AN

ARCHITECTURAL TOUR

IN

NORMANDY;

WITH

SOME REMARKS

ON

NORMAN ARCHITECTURE.

BY

HENRY GALLY KNIGHT, ESQ., M.P.

LONDON:
JOHN MURRAY, ALBEMARLE STREET.

MDCCCXXXVI.

G WOODFALL, ANGEL COURT, SKINNER STREET, LONDON.

ADVERTISEMENT.

The only merit to which the Author of the following pages can lay claim, is that of a conscientious and diligent endeavour to arrive at the truth.

In matters of antiquarian research truth depends upon accurate dates, and the difficulty of arriving at accurate dates can only be estimated by those who have sought after them. Dates abound in comparatively modern times, and when they cease to be important, but few can be discovered relating to early buildings, and affording satisfactory evidence on controverted points.

With respect to the dates of such buildings as form the subject of the following inquiry, it might be expected that they could have been ascer-

tained without much difficulty. Folios upon folios exist professing to give a complete account of every church and convent in France. Every thing might be hoped from the Gallia Christiana, and the Neustria Pia, compiled by men of learning and ability, who had access to all the ecclesiastical records, and original documents. But whilst these ponderous volumes offer an abundance of uninteresting details, they but too frequently throw no light upon the subject which requires elucidation.

On the other hand, the buildings themselves were liable to a repetition of injuries such as those only who have studied the chronicles of the Middle Ages, are aware of. The frequency of the destruction of churches in those troubled times is only less remarkable than the facility and celerity with which they were restored. It must be remembered, that, in those days, all towns, as well as villages, were invariably, and exclusively, constructed of wood; that local, as well as general, wars, were constantly taking

place, and that, on those occasions, fire was as regularly used as an engine of destruction as the sword. The first thing which an assailant did, was to throw combustibles into the place besieged[a], and the usual result was the entire destruction of the town, together with its churches.

Add to the conflagrations of war, the fires which arose from the negligence of plumbers, from lightning, or other accidental causes, and it will be seen how many changes Vulcan alone has brought about in ecclesiastical buildings.

Nor must it be forgotten, that there have been no less than five periods at which the demons of destruction have been more especially let loose in that country, of which I am about to describe a part.

1. During the ravages of the Normans in the ninth century.

---

[a] The feudal chiefs seem to have employed something like the celebrated Greek fire.

2. During the wars between John of England and Philip Augustus of France.

3. During the invasion of France by our Henry the Fifth.

4th. During the religious wars in the sixteenth century.

5th. During the French revolution.

Another source of change arose from prosperity itself,—from the wealth of the monastic fraternities, which enabled them to pull down, and rebuild, (frequently at surprisingly short intervals,) to increase the magnificence of their fabrics, or to fall in with the architectural fashion of the day.

With all these opportunities of destruction, and causes of change, the wonder is not that so much has perished, but that so much remains. It will, however, be seen at once that, as the fortunes of ecclesiastical buildings have been exposed to so many vicissitudes, and as the annals, which record those fortunes, are so meagre, it must be a task of no small difficulty to discover the dates not

only of existing buildings, but of the particular portions of those buildings upon which the solution of antiquarian problems frequently depends.

Something may be done by a patient perusal of the chronicles and local histories—in which events are sometimes found which throw unexpected light on the object of inquiry; but the monkish writers are so little exact in their expressions that their words must always be weighed with great caution. To produce the more effect, they often give you to understand that the whole church was destroyed when it was only damaged, or that an entirely new church was built by the individual who only added, perhaps only begun, a part. A consecration does not always imply a total reconstruction. A new consecration often took place when any thing considerable had been done to the fabric. On the other hand, the discovery and translation of the body of a saint deserves attention;—for such incitements to the zeal and liberality of the faithful, were seldom resorted

to, unless an unusual outlay was become a matter of necessity.

Information, however, of this kind is rather circumstantial evidence, than direct—rather approximation, than proof.

The best evidence is contained in the buildings themselves,—the evidence of construction and style. This evidence is a fact, and a fact of more weight than bushels of inferences, conjectures, and opinions. Against the evidence of style, the evidence of silence (often much insisted upon) is of no avail, for unrecorded ruin is, in any instance, much more probable than the real existence of an unprecedented anomaly.

Such is the best assistance on which the antiquary has to depend; such are the difficulties which beset his path. They must plead my excuse, if the information contained in the following pages should appear to be scanty. The little there is will, I venture to hope, be found to be correct.

NORMAN ARCHITECTURE.

CHAPTER I.

INTRODUCTION.—DIEPPE.—FECAMP.

THE startling dates assigned, by the Norman Society of Antiquaries, to some churches in the pointed style in Normandy, could not but excite considerable surprise and curiosity in other countries. The Society, in their Report for the year 1825, depose that churches exist in Normandy, at Coutances, Mortain, and other places, which were built in the *eleventh century*, and built in the *pointed style*. It would not have been surprising, if France had done nothing more than assert her prior claim to the adoption of the

pointed style, but that instances of the complete development of that style should be found any where of such unsuspected antiquity, was enough to create astonishment.

Under these circumstances, I determined to cross the water for the sake of inspecting and examining the architectural miracles in question. On so particular an occasion, I resolved not merely to trust to my own judgement, and engaged an architect by profession, Mr. Richard Hussey, to be my companion; that I might have the assistance of a practised eye to examine the construction of the buildings, and a practised hand to delineate their outline.

We left Brighton on the 15th of May, 1831, by the steam-boat, and in eight hours arrived at Dieppe.

Dieppe is an old-fashioned respectable-looking town, principally of brick, with houses of which the high roofs are relieved by dormer windows. It is nearly surrounded by low hills, which are, in many places, embellished by trees. On all this part of the French coast, trees approach the sea

as fearlessly as they do in the Isle of Wight. The principal church of Dieppe, that of St. Jacques, is of stone, large, and handsome; the south transept is as old as the beginning of the thirteenth century, but the greater part of it must have been rebuilt two centuries later.

May 16.—From Dieppe we travelled through an hilly country, of which the high ground is bare; but each of many successive valleys has its clear stream, and its pretty village, surrounded by trees and orchards.

Near the village of Cany we saw a large chateau, which belongs to the Duc de Luxembourg, and which is occasionally inhabited by the family.

After a long descent, we arrived at Fécamp, a small town which originally grew up round a once celebrated monastery. It stands on rising ground in a valley which is open to the sea, and, thus situated, the hallowed pile could not fail to attract the attention and oblations of mariners. The monastery was entirely destroyed at the French revolution, but the church survives, and is a fine building.

There was a religious foundation at this place in very early times; but the first building shared the fate of so many others, and was destroyed by the men of the North whilst they were yet pirates and pagans.—During nearly the whole of the ninth century, these terrible strangers returned to the shores of France, sailed up the rivers, carried desolation into the heart of the country, and, having at first been satisfied with plunder, finally would not be dismissed. As the only means of restoring peace to his kingdom, Charles the Simple agreed to confer Neustria on the victorious Rollo [a], who consented to do homage for the province, and become a Christian. The men of the North were gifted with intellect as well as courage.—

---

[a] The Chronique de Normandie mentions these conditions, and adds that "Quand Rou vint faire son homage, il ne deigna pas se baisser, mais print le pied du Roy, et le leva si haut que le Roy cheut, dont il sortit grande risée;" and such was the weakness of the French monarchy, at that period, that the king and his court were obliged to restrain all expression of resentment at so coarse an insult.

What they had acquired by valour, they governed with wisdom, and, having restored prosperity to a land which they had laid waste, they soon displayed as much zeal in the restoration and embellishment of religious edifices as they had before displayed in their destruction. Fécamp was one of the buildings so destroyed, and so restored;—but, subsequently, it underwent so much alteration as to offer an example (in common with so many other churches) of the old knife with a new blade and a new handle.

The body of the present church is of one character. It is in the pointed style, well constructed, and handsome. The style corresponds with that of the earlier part of the reign of our Henry the Third,—that is to say, early pointed. A wide triforium, or gallery, with plain, divided arches, is carried along either side of the nave. On the south side of the choir are arches of a later date, supported by very light and beautiful ribbed piers, having the appearance of large clusters of slender shafts. Behind the high altar is a Lady's chapel,

of a later date than the body of the church. The Norman traces only appear in the extreme circular apsis of the choir, (in an altered state,) together with two side chapels on the north-east, and a connecting portion of the aisle.

The restoration of the church of Fécamp was begun by Richard, Duke of Normandy, first of that name. The church was so far advanced in 990 [a], that it was consecrated in that year. Richard's son finished the church, and added the monastic buildings.

Abbot William, who died in 1107, pulled down the east end of the church, which Richard had built, and reconstructed it on a larger scale [b]. On this occasion there was a second consecration.

In 1167 [c] the church was greatly damaged by fire.—Abbot Radulfus, who died in 1220, is related, in the Gallia Christiana, to have completed the second restoration of the church. From this

---

[a] Gallia Christiana. [b] Ordericus Vitalis.

[c] 1167.—Fiscannense Monasterium combustum est. Rupertus de Monte in Appendice ad Sigebertum.

it is clear that he must at least have made considerable progress in the work.

Such are the scanty records, relating to this celebrated monastery, which have come down to our time.

If, with these dates before us, we examine the different parts of the existing fabric, we shall perceive that the Norman chapels behind the choir can only be the remains of the alterations which were finished before 1107; and that the body of the church must be that part in which Abbot Radulfus made considerable progress. The Lady's chapel was probably built by Abbot William[a], as he appears to have been the first abbot who was buried within its walls. He died in 1260. The south side of the choir must have been a later reconstruction, as, from its style, it belongs to the fourteenth century, but nothing is to be found about it in the chronicles of the convent.

Of Duke Richard's work not a fragment remains, unless some substructions, upon which the

[a] 1260.—"Gulielmus Abbas tumulatus est in Sacello Beatæ Mariæ." Gallia Christiana.

existing Norman work rests, and which may be discerned on a close examination, at the north-east point, belong to his time.

Some of the tombs of the abbots still exist. The most ancient is that of Abbot Richard I., who died in 1223. Within the beautiful chapel of St. Andrew, are the tombs of Abbot William de Putot[a], who died in 1297, and of Abbot Robert de Putot, who died in 1326. The recumbent figure of Abbot Richard is not without grace, but retains some of the meagreness which characterises early sculpture. The effigies of Abbots William and Robert recline on altar tombs, and respectively exhibit the progressive advance of art, in the bolder proportions of the figure, and the breadth of the drapery. Each head rests under a canopy, of which the latest is the most ornamental. The altar tombs are much enriched with figures in relief, under crocketed arches.

---

[a] A MS. in the possession of M. Langlois, of Rouen, says that Abbot William de Putot built both the chapel of St. Andrew, and the adjoining chapel of St. John.

CHAPTER II.

CAUDEBEC.—BANKS OF THE SEINE.—ST. WANDRILLE. —JUMIEGES.—ST. GEORGES DE BOSCHERVILLE.

FROM Fécamp we drove on to Yvetot, where we slept.

At Yvetot we were again on high ground. Soon after our departure from that place, our road began to descend through a long, winding gorge, which affords a passage, between wooded hills, to the small, scattered town of Caudebec, on the margin of the Seine. This is indeed a lovely spot, offering many a picturesque combination of trees, houses, and river. Here is another handsome church, with a spire which is all filagree work in stone. This church is not older than the fifteenth century.

After Caudebec the road is for some time carried along a terrace half way up the side of the

wooded hills. From thence you command varied and beautiful views, often through trees, of the truly magnificent river and the broad valley through which it runs. Chalky cliffs, seamed with strata of flint, break through the green fringe at intervals, and remind you of those of England. Few things can be more agreeable than rolling along this terrace of a sunshiny day. I have seen no river scenery which excels this part of the Seine.

We soon came to the turn which leads up to St. Wandrille, another ci-devant monastery, beautifully embosomed in woods and hills. Here the conventual buildings remain, but the church is almost entirely gone, having been taken down, for the value of the materials, by the individual who became its proprietor, for a few assignats, at the revolution. The old convent, and the pastures around it, might easily be converted into a delightful residence and park in the English taste—as has happened to many an old convent in England.

Returning to the great road, we left it again on the contrary side, to visit the celebrated Abbey of Jumiéges. Normandy, and especially the neighbourhood of Rouen, was completely studded with these great convents, many of them the works of the Dukes of Normandy, before, and after, they became kings of England. A great proportion of these convents arose in the eleventh century, when the province had entirely recovered from its past calamities. "In those days," says a cotemporary writer, "all the great proprietors built churches on their estates, and endowed monasteries;" and it must be allowed that, if monastic institutions are no longer wanted, in those times they were essential to the preservation of learning and the arts, and that the influence of the clergy afforded the only restraint capable of mitigating the fierceness of the age.

The Abbey of Jumiéges stands on the lower level between the hills and the Seine, but on

---

[a] "Unus quisque optimatum certabat in prædio suo ecclesias fabricare." Gulielmus Gemeticus.

slightly elevated ground. The conventual buildings are gone, with the exception of the gatehouse, which is converted into a dwelling. A considerable part of the church was pulled down at the Revolution, but, fortunately, those parts which remain are the most ancient, and those which produce the most effect. The pointed reconstructions are in ruins, but the Norman towers survive.

This is a noble pile, a fine specimen of the grand simplicity of the early Normans. Here is little or no ornament. The whole effect is produced by size, height, and a few great features. Witness the magnificent arches under the central tower;—witness the length, breadth, and height of the nave, and the elevation of the western façade.

The arches of the nave rest on piers to which half pillars are attached, alternating with large single pillars, which are built in courses. All the capitals are plain. Some of the capitals retain the Norman painting, which is a rude imitation of leaves.

C Burton delt [illegible] lith

JEUMIEGE ABBEY CHURCH, LOOKING WEST

London, [illegible] Murray [illegible] St. [illegible]

Above the aisles, on either side of the nave, are wide galleries. The roof is entirely gone.

The whole of this building is well constructed of blocks of chalk-stone, seamed with flint, brought from the neighbouring hills. The joints between the stones are wide.

Besides the central tower, which is nearly gone, there were towers at either angle of the west front, and these remain. They are octagonal, but do not exactly correspond. The west portal is remarkably plain, and of a Roman character. Its round arch, without a single moulding, rests on two pillars.

Adjoining to the abbey church is a smaller church of good architecture, in the advanced pointed style.

The first church which was erected at Jumiéges, (Gemetium,) was built in 655 by St. Philibert, during the reign of Clovis the Second[a]. This church was destroyed by the Normans.

Rollo's son, Duke William the First, recalled

---

[a] Gallia Christiana.

Jumiéges into existence, in 940[a], but appears rather to have repaired the ruined church than to have built a new one; for, about a century afterwards, Abbot Robert the Second laid the foundations of another church on the same spot. This church was consecrated in 1067[b], and of this building the Norman remains which exist are a part.

The east end and the choir were rebuilt long afterwards in the pointed style. This alteration appears to have been undertaken by Abbot Robert, who afterwards became Archbishop of Rouen, and was buried in the church of the Abbey of Mortemer, in 1230[c]. An ancient MS.[d] represents him to have entirely rebuilt Jumiéges, but the Norman remains, which are still in existence, sufficiently prove the inaccuracy of this assertion. Loose expressions of this nature, founded on truth, but exceeding the truth, frequently occur in the

---

[a] Gallia Christiana. [b] Gallia Christiana. [c] Neustria Pia.

[d] MS. quoted in Pommeraye. Histoire des Archevèques de Rouen.

monkish chronicles, and have led to much confusion.

A second consecration of the Abbey Church of Jumiéges took place in 1252, by which time the alterations of the east end were probably finished.

With regard to the small church, I have only been able to discover that an abbot was buried in its chancel in 1330 [a], and that it was much altered ten years afterwards, (in 1340,) by Abbot William the Seventh.

Charles VII. of France was so fond of Jumiéges, that he added to the convent an apartment for his own occasional occupation, perhaps because the beautiful Agnes Sorel resided in the neighbourhood.

The heart of Agnes Sorel was deposited in the church of this abbey [b], which she had endowed

---

[a] Gallia Christiana.

[b] Neustria Pia. The epitaph inscribed on her tomb was:—" C'y git Damoiselle Agnes Seurelle, en son vivant Dame de Breauté, Dissoldun, et Vernon sur Seine—pieteuse aux

with large estates. Her body was buried at Losches.

At a short distance from the abbey is the parish church of Jumiéges. This is also a Norman building of large dimensions. This church is believed to have been erected by the monks of Jumiéges, during the abbacy of Waso, about 1106. Here are square piers, without pillars, on each side of the nave.

The parish church is more advantageously situated than the abbey, and commands a view of the river.

Leaving Jumiéges, we regained the high road, and proceeded to Duchér, a small town on the banks of the Seine.

Soon after Duchér we began to ascend, and

---

pauvres—laquelle trespassa le neuvième jour de Février, en l'an 1449."

The expression of Dame de Breauté, (lady of the manor of Breauté,) has led more than one French writer into the error of informing his readers that Agnes went by the name of La Dame de Beauté, which, however, was not far from the mark.

again diverging from the road, arrived at the ci-devant abbey of St. Georges de Boscherville, which stands on the western slope of a lofty hill, with a woody region at its back.

The convent is nearly destroyed, but the church remains entire, having been adopted as the parish church of the place.

St. Georges de Boscherville, resembling the Norman buildings in its noble dimensions, its central tower, and its lofty western façade, retains the same principle of simplicity, but is rather more ornamented than Jumiéges.

The portal is enriched with a series of mouldings of different patterns, and the capitals of the small pillars, on either side, exhibit rude images.

Within, all is plain with the exception of the capitals of the pillars, which, a step in advance of the painted capitals of Jumiéges, are ornamented with foliage in stone, and a few rude figures. The capitals of the pillars at the upper end of the church are the most enriched.

One or two rude groups of figures are let into the walls as medallions.

The arches of the nave rest on piers to which half pillars are attached. The transepts are divided from the nave by two arches resting on a single pillar, which has a base and a capital.

The choir retains its original Norman vaulting. The nave is vaulted in a different manner, as if the vaulting had, at a later period, replaced an earlier roof of wood.

The windows are large, round-headed, with mouldings, and have, externally, a small recessed pillar on either side.

The cornice under the eaves is the plain semi-circular moulding.

The stones, of which the walls are built, are squared, regular, and of a medium size. The joints, without being fine, are not remarkably wide.

The only other part of the abbey which remains entire is the chapter-house, which is an handsome, oblong hall, and a good specimen of the transition

style, exhibiting a mixture of round and pointed forms.

St. Georges de Boscherville is peculiarly interesting from the certainty of its date. It is known to have been built by Raoul de Tancarville[a], who was chamberlain to William the Conqueror.

The church was consecrated in the presence of Raoul de Tancarville, his wife, and two of his sons, Raoul and Rabel.

In 1114 William, the fifth son of the founder, expelled the secular canons of Boscherville, and substituted Benedictine monks in their place. His architectural operations, however, appear to have been confined to the monastic buildings. In the grant which he received from King Henry I., to cut wood in an adjacent forest, the words are, "Omne lignum ad opus constructionis istius *abbatiæ* necessarium." At the same time it is not

---

[a] In the charter of confirmation granted by William the Conqueror, a copy of which still exists in the public library at Rouen, it is expressly stated that Raoul de Tancarville ecclesiam reedificare cœpit a fundamentis et consummavit.

impossible that he may have done something to the church, of which the great western portal is so much more enriched than was usual in the times of the Conqueror, as to make it rather appear to be the work of the son than of the father.

The chapter house was built by Abbot Victor, who became abbot in 1157, and died in 1211[a]. He is believed, about the same time, to have built a cloister, demolished in the sixteenth century by one of his successors, to make room for another in the fashion of the day.

Returning to the high road, we traversed the crest of the hill, and soon after beginning to descend, burst upon a magnificent view of Rouen and its environs. The towers of Notre Dame and St. Ouen, rising above the rest of the city, the surrounding hills, the green meadows, the river, the islands, and the shipping, combined to form as splendid and gay a picture as ever an evening sun displayed to advantage.

---

[a] "Victor obiit ante annum 1211, sepultus in capitulo quod erexerat." Gallia Christiana.

We soon found ourselves amongst scattered villas and buildings, entered the long avenue which forms so noble an approach, and arrived at the Hotel de Rouen, on the quay.

CHAPTER III.

ROUEN.

Rouen having been, of late years, greatly improved, is a less picturesque object than it was. A magnificent quay, which is carried along the side of the river for a considerable extent, and which is bordered by a long row of high, well-looking houses, has succeeded to rubbishy walls, and irregular, half-timber buildings. But the unity of the antique character of the city is destroyed; and it is only in the interior that the unaltered, aboriginal, streets remain. Reason admits the improvement, but imagination regrets the past.

Still, perhaps no town possesses a richer collection of those old half-timber buildings which, formerly, were universal; and, in rambling through Rouen, the artist is arrested at every step by the variety and the picturesque combinations of gable

ends of all heights and dimensions, projecting windows, jutting beams, pendent corbels, and fantastical ornaments.

The antiquary will be disappointed if he expects to reap an harvest of ancient Norman in Rouen. Cities that prosper the most retain the least of their primitive structures. Improvement, constantly at work, removes the old buildings to obtain more convenient thoroughfares, or works them up into more fashionable forms.

Rouen was the first, and long the chief residence of the Dukes of Normandy, an honour subsequently shared with Caen and Falaise.

Rollo, first Duke of Normandy, built a castellated residence at Rouen.

In 996, Richard Sanspeur built another[a], to which the old bridge conducted. Every thing

---

[a] This castle stood nearly on the place which is now occupied by les Halles. It was at a short distance from the river. To this castle the unfortunate Arthur, Duke of Brittany, was removed by King John from Falaise, and was never again seen alive.

was originally done by, and for, the feudal lord; and this accounts for the site of many public buildings which we find placed with little reference to public convenience. They have remained, and even been rebuilt, in situations where they were originally placed for another object.

Of these palaces not a trace remains, and only a trace of the castle built long afterwards by Philip Augustus in a more elevated situation.

But if Rouen possesses few vestiges of its earliest days, it is rich in examples of every variety of style, from the best period of the pointed, down to what is called the renaissance style of Francis the First.

CHURCH OF ST. OUEN.

In the pointed style, Rouen may boast of the possession of one of the most perfect specimens that exist. I know of nothing which, in beauty or in taste, excels the church of St. Ouen. It is the very triumph of the pointed style. The principles of elevation, of lightness combined with strength, and of enrichment without exu-

berance, are all here displayed in all their perfection. Elevation seems to have been the favourite *tour de force* of the French architects, and of this the nave of St. Ouen affords a remarkable instance. The consequent height of the arches on each side of the nave, and the corresponding size of the double row of splendid windows, above and below, give this building an air of lightness peculiar to itself; whilst the fancy and delicacy of the decorations, the varied tracery of the windows, the tracery of the roof, and the last finish of the magnificent painted glass, leave nothing to be desired. I must not omit to mention the beautiful rose windows of different patterns which St. Ouen possesses, which are so great an ornament of the churches in which they are found, and in which France is so much richer than England.

The history of this Church will give an idea of the frequent destruction to which churches were liable in former times, and of the facility, and celerity, with which they were restored.

The first church erected on this spot was erected by Clotaire, king of the Franks, about 538, and dedicated to St. Peter[a].

In 683, the body of St. Ouen, who died archbishop of Rouen in 678[b], was removed into the church built by Clotaire.

This church was destroyed by the Normans.

About 976[c], Richard, the first duke of Normandy, began a new church, thenceforth called St. Ouen, in honour of the saint whose ashes it contained. This church was not finished till 1126, and was destroyed by fire ten years afterwards[d]. A third church arose with the assistance of the Empress Maud, and other benefactors, which third church was burnt down in 1201[e]. A fourth succeeded, to share the same fate in 1248[f].

The existing Church, which is the *fifth*, was begun in 1319, and carried on, at intervals, till

---

[a] Neustria Pia.
[b] Ordericus Vitalis.
[c] Ordericus Vitalis.
[d] Neustria Pia.
[e] Gallia Christiana.
[f] Neustria Pia.

1514;—after all, it is left incomplete, one of its western towers never having been carried up[a].

One of the very few relics of the ancient Norman style, in Rouen, is preserved in one of the belfrys at the eastern end of this building. It is called La Chambre aux Clercs, and is either a fragment of the second, or the third, church; more probably of the third.

The Cathedral is another magnificent building, but inferior in beauty to St. Ouen, and not quite its equal in size.

The nave is lofty and handsome, in a good style of unenriched architecture. The choir is separated from the rest of the church, not by arches, but pillars; which are more common in combination with the pointed style in France than in England. The great western façade exemplifies the corruption of taste in later times. It is viciously florid. It looks like a piece of rockwork, devoid, as it is, of windows, and rough and incrusted

[a] The length of this church is 416 (French) feet, and the nave is 100 feet high.

with images and tabernacles and ornaments from top to bottom; yet is there an expanse and a grandeur about it which cannot be viewed without admiration.

All that is known of the early history of the Cathedral of Rouen is, that the eleventh century cathedral was burnt down in 1200[a], and that

---

[a] Anno 1200—" Urbs Rotomagensis, cum ipsâ matre Ecclesiâ, gravi incendio corruit."—Anonymi continuatio Appendicis Roberti de Monte.

" M.C.C.—Hoc anno, iv. Idus Aprilis, in Nocte Paschæ, combusta est tota Ecclesia Rotomagensis, cum omnibus campanis, libris, et ornamentis Ecclesiæ, et maxima pars civitatis."—Chronicus Rotomagensis.

This fact is confirmed by a Brief preserved amongst the records in the Tower of London. The brief bears date 1201, being the 2d of John. The words are, " Ad vestram credimus pervenisse notitiam qualiter Ecclesia Rothomagensis, quæ est mater ecclesiarum Normannorum, quam plurimum diligimus, igne combusta sit et funditus fere destructa. Ea propter rogamus," &c., &c.

For the above extract, and for much other valuable information, I am indebted to the kindness of Mr. John Gage, whose name is a sufficient security for acute, correct, and conscientious, research.

in the early part of the thirteenth century, Ingelramus, the architect, who about the same time was employed to rebuild the abbey church of Bec, was engaged in the restoration of the Cathedral of Rouen[a]. Of his work there appear to be traces in the lower part of the north-western tower, and the adjoining part of the west front, together with both the lateral portals. All these portions are in the early pointed style—in a totally different style from that of the centre portal, and the florid enrichments with which the west front was long after adorned. The reconstruction went on during the greater part of the thirteenth century, but must have been completed in the course of it, for we find that, in the year 1302[b], the Chapter took down the

---

[a] "La Chronique de l'Abbaye du Bec en Normandie fait mention d'un nommé Ingelramne, qui ayant eu la conduite de l'Eglise de Notre Dame à Rouen, au commencement du troizième siècle, entreprit aussi l'Eglise du Bec sous Richard III., Abbé du lieu."—Félibien, Histoire des Architectes, livre iv., page 205.

[b] Pommeraye, Histoire de l'Eglise Metropolitaine de Rouen.

Lady's Chapel at the east end, (considering it too small,) and began the one which at present exists[a]. Much about the same time was undertaken the beautiful northern portal, known by the name of the Portail des Libraires, though it was not entirely finished till 1478.

The north-western tower was finished in 1477. The more noble tower at the south-eastern angle was begun in 1485, and finished in 1507.

The first stone of the appliqué to the western façade was laid in 1509[b], and the whole was finished in 1530. This was the work of Cardinal D'Amboise, then archbishop of Rouen.

The same munificent prelate renewed the roof of the choir, which had been destroyed by that common bane of churches, the carelessness of plumbers. The fire took place in 1514. The new roof of the choir is more elevated than that of the nave.

The Palais de Justice and La Sale des Pro-

---

[a] The cathedral is, altogether, 408 (French) feet long, and the nave is 84 feet high.

[b] Pommeraye.

cureurs, which is a wing of the same building, are rich specimens of the less pure and obtuse style of the fifteenth century. The Sale des Procureurs was built in 1493, for an exchange, and the Palais de Justice was added for an exchequer, by Louis XII., in 1499. La Sale des Procureurs is a little Westminster Hall.

Of the rénaissance style, which corresponds with that of our James I., and may be called the second transition, Rouen possesses a variety of specimens both in wood and stone.

Of the stone buildings La Maison de Bourgtheroude is the most remarkable. The surface of its walls is divided into compartments by pilasters, and these compartments are enriched with crowded relievos, more after the minute and elaborate manner of a cabinet, than of a building of stone, which is destined to resist the outward air. The relievos represent the interview of Francis I. and Henry VIII.

The apartments of the abbess in the ci-devant

convent of St. Amand, are another rich and curious specimen of this peculiar style—but perhaps have ceased to exist, as the convent was half demolished when I saw it.

The two remains of the greatest antiquity at Rouen are without the walls, at opposite extremities of the city; the one at the east, the other at the west.

The one at the east is the small Church of St. Paul, of which the date is unknown, but which is certainly very early Norman. The plan of this building is singular: its chancel is composed of three large semicircular recesses, one at the end, and one on each side. Under the eaves of this part of the building are very curious corbels, most of which are in the shape of human heads.

This church stands on rising ground below Mount St. Catherine, near the road to Paris.

The other architectural curiosity lays claim to more than Norman antiquity. This valued relic

is the Crypt of St. Gervais, which is believed to be the same that received the body of the Saint in the fourth century.

The situation of the Church of St. Gervais is in favour of the truth of the story. It stands on high ground, at the western extremity of the city, and by the side of what was the old Roman way from Rouen to Lillebone. Nothing, therefore, is more probable than that the Saint should have been buried where it was customary to bury in those times, by the way side, and without the city. The Crypt is that sort of strong, unornamented structure, which might endure for any period of time, and the slight peculiarities which are still to be traced in its construction are of a Roman character. Courses of thin brick, or tile, are observable between the courses of stone. This was the manner in which the Romans often built their walls in the lower times of the empire, and the same kind of construction is to be seen in the walls of the remains of buildings allowed to be Ro-

man in other parts of France. The walls of the Crypt may, therefore, be deemed original, but the vault has been restored, and the polygonal absis above the Crypt is evidently a reconstruction—for none of its parts agree. It is, however, possible that it may have been rebuilt with the fragments of its predecessor, for the capitals of the half pillars which ornament its exterior are very like bad Roman, and not at all like early Norman; and, from the peculiar sanctity of the spot, it is probable that this building would be restored amongst the first. All, however, that can be asserted is, that Roman fragments appear to have been introduced whenever this apsis was rebuilt.

In the church itself there is nothing remarkable. A priory, which has ceased to exist, was formerly attached to this church. The tranquil seclusion of this religious house induced William the Conqueror to order himself to be carried there when oppressed by his last illness. It was there he expired, and there took place that

extraordinary scene, which, whilst it teaches princes to reflect, offers a revolting spectacle of baseness and ingratitude. Scarcely had the Conqueror breathed his last, when the lords, who attended him, hurried away to their castles, the servants, who remained, plundered the apartment and disappeared, and the body of that great prince was left utterly alone. So complete was the desertion, that when, after some time, the ecclesiastics had repaired in procession to St. Gervais, and the archbishop had directed that the body should be removed to Caen, there to be interred in the church which the Conqueror had raised, not an individual was to be found who would take charge of the funeral. At length one of those gallant spirits who, on most urgent occasions, come forward to redeem the character of human nature, Herluinus, a knight residing in the neighbourhood, bound by no ties to William, and wholly disinterested in the matter, was moved by his own heart to supply the place of those whose duty it was to be

there; and having procured all that was necessary, *at his own expense*, he caused the body to be removed, and himself escorted it, by water and by land, to Caen[a].

---

[a] Ordericus Vitalis.—A verbal error in most of the copies of Ordericus, has led some authors into the mistake of representing that the body of the Conqueror was taken, in the first instance, to St. Georges de Boscherville; ad Sanctum Georgium is written, instead of ad Sanctum Gervasium; but the whole context of the remainder of the passage clearly establishes which it should be.

CHAPTER IV.

CHAPEL OF ST. JULIEN.—LIONS-LA-FORET.—
CONVENT OF MORTEMER.

On the south side of the Seine, about three miles from Rouen, is a chapel which was built by one of our kings. It is called the Chapel of St. Julien. In the year 1160[a], Henry II. of England enclosed a park, and built a royal mansion, in this situation, and, soon after, within the precincts of the park, founded a Priory, of which this chapel is the only vestige.

The chapel is much degraded and mutilated, having been converted into a stable by the present proprietor. "Cela fait une tres bonne

[a] "Anno 1160, Henricus Rex, parcum et mansionem regiam fecit juxta Rotomagum."—Rupertus de Monte.

écurie, n'est ce pas?" said the servant who showed it me. "Cela devient utile pour la première fois."

The chapel consists of a nave without side aisles. It has a semicircular apsis. The half pillars which run up the sides to support the roof have foliage capitals of different patterns. The lower part of the walls of the interior, as high as the bottom of the windows, is ornamented with a series of dwarf half pillars and round arches. The windows and doors are round headed. Under the eaves of the roof is a cornice of grotesque heads. The flatness of the external walls is relieved by thin buttresses, which terminate at the eaves. The workmanship is good throughout, and when perfect, this building must have possessed a character of great elegance.

On my way back to Rouen I was attracted by historical associations to the convent of Les bonnes Nouvelles, originally founded by Matilda, in memorial of her reception of the news of the conquest of England. Not a fragment, how-

ever, of the original building remains[a], and the church, which replaced it many centuries after, is converted into a barrack.

Another day I made a more distant expedition to visit the ruins of another work of Henry II., the ci-devant convent of Mortemer, which stands at a short distance from Lions-la-Forêt.

For this expedition I hired a cabriolet at Rouen, and on this occasion was initiated into the sufferings which await the antiquary who is induced, by the ardour of his zeal, to extend his researches beyond the borders of the high roads of France. If the cabriolet had not been as strong as a cart, it would never have survived the roughness of the *traverse* which conducts to Lions-la-Forêt. The straining horse could with difficulty drag us

---

[a] "The first church was finished by Henry I., and, in this church, the body of Arthur, Duke of Brittany, was buried. This church was burnt down in 1243. The second was destroyed by lightning in 1351. The third was greatly damaged by the Huguenots in 1562, and totally destroyed by Henry IV. when he besieged Rouen, in 1591. The existing building was begun in 1603." Description de la Haute Normandie.

through the ruts and holes which jolted us to pieces. Our only respite was when we fairly took the fields, which, in unenclosed France, is a resource of which the traveller frequently avails himself.

Lions is approached through the remains of a forest to which it owes its surname. To this forest, once of great extent, and convenient from its vicinity to Rouen, the Dukes of Normandy eagerly resorted for the diversion of the chase, a pursuit for which they became but too renowned, but which they learnt from others. Sailors are not hunters; and the Normans, who first settled in Neustria, were men of the sea; but, when they mixed with the Franks on terms of friendship, they beheld the splendid hunting parties which were the delight and the pride of the Merovingian kings[a], and, very naturally, adopted a diversion

[a] When Clovis divided his kingdom between his four sons, he bequeathed to each of them the right of hunting in the Foret de Cuise near Soissons, which was so favourite an hunting ground, that not one of the brothers would have peaceably relinquished the privilege.

which supplied an excitement almost necessary to warriors in peaceable times. So early as 929, William I., Duke of Normandy, built an hunting box at Lions, which afterwards became a castle important from its strength. La Forét de Lions was the scene of many of the adventures which are recorded in the old chronicles and romances.

Lions stands on a mound in a valley. The castle, and all that gave consequence to the place, is gone. The straggling town is entirely composed of half timber houses, and consists of two separate villages, once united by streets which have long disappeared. You distinguish a convent metamorphosed into a manufactory, and a few houses of persons in easy circumstances, amongst which that of the notaire and the pharmacien are, of course, conspicuous. Even here is a Salon de Biliard, and a Café, which, in France, are indispensables. I was glad to hear of two inhabited chateaux in the neighbourhood.

From hence I walked to Mortemer, which is about two miles from the town. Ascending the hill,

I plunged into a wild romantic forest, which formerly belonged to the monks, and in which they amused their leisure hours. My guide regaled me with anecdotes of the prowess of one of the three monks who occupied the convent at the time of the dissolution. " C'etoit un brave chasseur, ce gaillard là !" Public opinion entertained so low an estimate of monastic institutions that, long before the decree of the National Assembly which terminated their existence, the religious houses were, for the most part, thinly tenanted. Few Frenchmen would embrace what was considered a profession of indolence and inutility.

The remains of the convent are pleasantly situated in the bottom of a deep valley, surrounded by hills covered with wood. A clear stream runs by the convent walls. The convent derived its name of Mortemer (mortuum mare) from the stagnant pools formed by this stream before it was confined within proper limits.

Almost the whole of the church is pulled down to within a few feet of the ground. No part re-

mains in any degree of preservation except the north transept, at the end of which is a large circular window, which does not appear ever to have had any tracery. From the shape of the rib which is still attached to the wall of the transept, the vaulting of the roof seems to have been pointed; but, from what can be collected from the few remaining architectural indications, round forms appear to have prevailed in the greater part of the building. The west front, however, which was standing a few years ago, and of which a view has been preserved by Taylor and Nodier, was in the early pointed style.

Adjoining to the church is the oldest part of the convent. This part remains nearly entire, and is an interesting specimen of the transition style, exhibiting a complete mixture of round and pointed forms. The doors of the chapter-house are round, and its coeval windows, pointed.

This church was begun[a] in 1154, at the ex-

---

[a] Neustria Pia.

pense of Henry II. of England, who urged on the work with so much ardour that the nave and transepts were finished in three years. About the same time his mother, the Empress Maud, caused two large buildings to be constructed in the vicinity for the reception of strangers.

By 1174 [a] the chapter-house must have been in existence, for Abbot Godfrey, who died in that year, was buried in that place.

The next abbot [b] laid the foundations of the east end of the church, and, with the assistance of a gift of one hundred pounds from the king, made some progress in this part of the work. In the time of his successor, Abbot William, the church was entirely finished [c], through the further assistance of eighty pounds [d], contributed by Froge-

[d] The Norman pound, and the Anglo-Norman pound,

rius, Bishop of Séez, for that purpose. Abbot William, also, sent one of his monks into England

---

were of the same value under the Norman kings, and were always divided into twenty shillings; each shilling being then, as now, divided into twelve pence.

All authorities agree that, in those times, the pound contained three times as much silver as at the present day, but they are by no means unanimous when they proceed to consider how much more three times as much silver *was worth* in the twelfth century than now.

Some estimate the difference so high as twenty to one. Others place it so low as five. According to Hume, it is ten. According to Lyttleton and Henry, it is five. But, whatever may have been the case seventy years ago, there appears to be every reason to believe that the difference between the value of that quantity of silver, in the twelfth century and at the present time, is at least as much as ten to one.

We find, in Bishop Fleetwood's Chronicon Preciosum, that, in the time of Henry I., (who reigned from 1100 to 1135,) forty sheep were valued at one pound, and that a stalled ox was worth one shilling.

In 1145 an ox was worth three shillings. If we multiply this sum by three, to allow for the diminished quantity of silver, and then by ten, the product will be four pounds ten shillings, a moderate price for a lean ox at the present day.

In 1185, the tenants of Shireborn were by custom to pay

to purchase lead, with which he made pipes to bring a supply of water from the upper part of the valley to the offices of the convent. Abbot William died either in 1200[a], or 1205[b].

Finally, the church was consecrated by Robert II., Archbishop of Rouen, in 1209[c].

---

either four hens, or twopence. Apply the same rule, and it raises the price of each hen to one shilling and threepence, a common price for a hen in country markets, at the present time.

Evidence of this kind is more to be depended upon than the comparative price of wheat, in calculations which have reference to so remote a period; because the notices of the price of wheat in those times, occur very rarely, and the article itself, from the imperfect state of agriculture, and the dearths arising out of the troubled state of society, was subject to such extraordinary fluctuations as to render it, during that period, by no means a safe criterion.

If, therefore, we believe that three times as much silver as the pound now contains, was worth ten times as much in the twelfth century as at the present day, we shall perceive that the Bishop of Séez gave, towards the building of the Abbey Church of Mortemer, what would now be worth two thousand four hundred pounds.

[a] Gallia Christiana. [b] Neustria Pia.

[c] Gallia Christiana.

It is probable that the west front was built the last, that is by Abbot William, at the close of the twelfth century.

I have given the history of this convent at the greater length, because it is seldom that so complete an account of the progress of a building has been preserved.

The remains of the convent, and part of its domain, have recently been purchased by an individual who meditates converting them into a country residence, and a delightful one they would make. The Englishman, who sees these things going on, figures to himself the aspect of his own country in the days of Henry VIII.

CHAPTER V.

BRIOM.—LISIEUX.

On our departure from Rouen, we crossed the Seine, and, from an eminence on the southern side, caught a magnificent view of the river, and its windings. Further on we saw, from the road, the situation of that once celebrated seat of learning, the Abbey of Bec[a], but we did not turn out

[a] The College of Bec owed its origin to the talents of the celebrated Lanfranc, afterwards Archbishop of Canterbury. Lanfranc was a native of Lombardy—who leaving Italy, for what reason is uncertain, established himself at Bec, and undertook to give lectures. His great reputation attracted the notice of William the Conqueror, who made him the first Abbot of his new Monastery at Caen, and, after the Conquest, promoted him to the See of Canterbury. An improvement in domestic architecture seems to have

of our way to pay it a visit, as, with the exception of a single tower, and some slight remains of the Norman building, it is now totally demolished.

We changed horses at Briom, and at la Poste had an opportunity of observing some of the effects of the French revolution. The house, which is now occupied by the post-master, was formerly the chateau of the seigneur of the place. The building, far too large for its present proprietor, exhibits all the marks of neglect and decay. The parterre, which you could trace by the box edging, was filled with weeds instead of flowers; and a stream, formerly enlarged into ornamental ponds and canals, now turns a mill which is esta-

---

been introduced at Bec, and not till the latter part of the twelfth century. Robertus de Monte records the death of Roger, Abbot of Bec in 1178, who, he says, added a building to his convent having *chambers with fire-places, one above another*, for the reception of strangers. This would hardly have been dwelt upon with so much minuteness, had it been done before.

blished in the pleasure-ground. "More useful as it is!" may be said by some. Perhaps so—yet no Englishman, contemplating his own garden, be it ever so large, or ever so small, would relish the idea of its being destined to undergo a similar change.

Arriving at Lisieux, a pretty, half-timber town pleasantly situated in a valley, we went to examine the cathedral, about the date of which much has been said. It is in itself a fine building, in the early pointed style, and, if in England, might be safely ascribed to the time of Henry III. The windows are lancet, but the arches rest on pillars with large heavy capitals of various patterns, some of which imitate the Roman.

It appears that a church stood on this identical spot, which was finished in 1077, and brought to an untimely end in 1136. During the troubles occasioned by the struggle between Stephen and the Empress Maud, the Counts of Anjou and Poitiers made an inroad into Normandy, and

attacked Lisieux. The town was set on fire, as usual, and a great part of it was consumed together with its cathedral [a].

Arnulfus, who was Bishop of Lisieux from 1140 to 1182, began and made considerable progress in a new church, and to him the existing church has been attributed [b]. But the pointed style in *his* time, had scarcely begun to appear in this part of France, and the style of the church in question is not even the pointed in its infancy, but such as it became when completely established. The real date of the existing church is disclosed in a single line of the Gallia Christiana, which,

---

[a] "Tunc ibi ecclesia Sancti Petri cum tota villâ concremata est."—Orderic. Vital. Hist. Lib. 13, p. 916.

[b] This supposition was encouraged by the following epitaph on a tomb within the existing cathedral.

"Hoc templum junctæque ædes, sunt Præsulis olim
Arnulfi antiquum Lixoniensis opus."

But the authors of the Gallia Christiana have the candour to mention that this was not the original inscription, but one which was substituted when a new monument, in comparatively modern times, was erected in honour of this prelate.

speaking of other things that occurred in the year 1226, mentions, incidentally, that in the same year the church of Lisieux was destroyed by fire[a]. Thus a second time the prey of the devouring element, the church was a second time restored. Some of the pillars, with their capitals, appear to belong rather to the twelfth than the thirteenth century; but portions of the preceding fabric may have escaped the flames, and have been combined, as was frequently done, with the new work of the repairs. The third cathedral must have been in at least a forward state in the year 1267, because in that year Bishop Fulco was buried in the choir[b]; and it was, probably, finished before 1299, because in that year Bishop William, the third, added a new chapel to the episcopal residence[c], and he would scarcely have undertaken another considerable work whilst his cathedral remained incomplete.

---

[a] "1226—igne combusta est Lexoviensis Ecclesia." Gallia Christiana.

[b] Ibid. [c] Ibid.

Such information as I have been able to meet with on this subject, was obtained, on the following day, in the public library at Caen. In all the larger towns of France there are excellent public libraries, arranged in spacious rooms, with salaried librarians, every accommodation for readers, and every disposition to assist them. I could not visit these libraries without wishing that similar institutions could be introduced in the principal towns of England, for in a country where there are so many persons whose circumstances allow them leisure, where education is more and more diffused every day, and in times when men's minds are on the stir, the easy access to books, in every part of the kingdom, could not but prove at once agreeable and beneficial. The encouragement of such an object would be a wise application of public money.

CHAPTER VI.

CAEN.—ST. ETIENNE.—ST. NICHOLAS.—ST. TRINITE.—ST. PIERRE.—ST. GEORGES DU CHATEAU.—FRESNE CAMILLY.—ANNISY.

Ridges of limestone, separated by wide flats of rich meadow, characterize that part of Normandy in which Caen is situated. Old Caen was placed on one of these ridges, but modern Caen has gradually spread over the lower ground. It is a large city, and, having inexhaustible quarries in its immediate vicinity, is entirely built of stone.

The limits of the present citadel are said to have originally been those of the town. Caen possesses several handsome churches, but its leading features are the two celebrated abbeys founded

and built by the Conqueror and his queen, at opposite extremities of the city. To these leading features must be added the spire of St. Pierre which is nearly in the centre of Caen, and which constantly attracts attention.

The exterior of the Conqueror's church surprises at first sight, because the eye is first caught by its spires, which are numerous and produce a good effect, but which you see at once belong to far later times than those of William. These are additions and restorations.

The west end, the whole body of the church, and the interior, with the exception of the choir, remain, as well they may from their strength and solidity, as the Conqueror left them. The stones of the walls are squared, and about a foot in width; the joints are rather wide, and the mortar is unsifted. The west portal is very plain. It has small recessed pillars at the sides, and a few mouldings without any enrichments.

There is a plainness about the exterior of the western façade of St. Etienne, its unadorned portal,

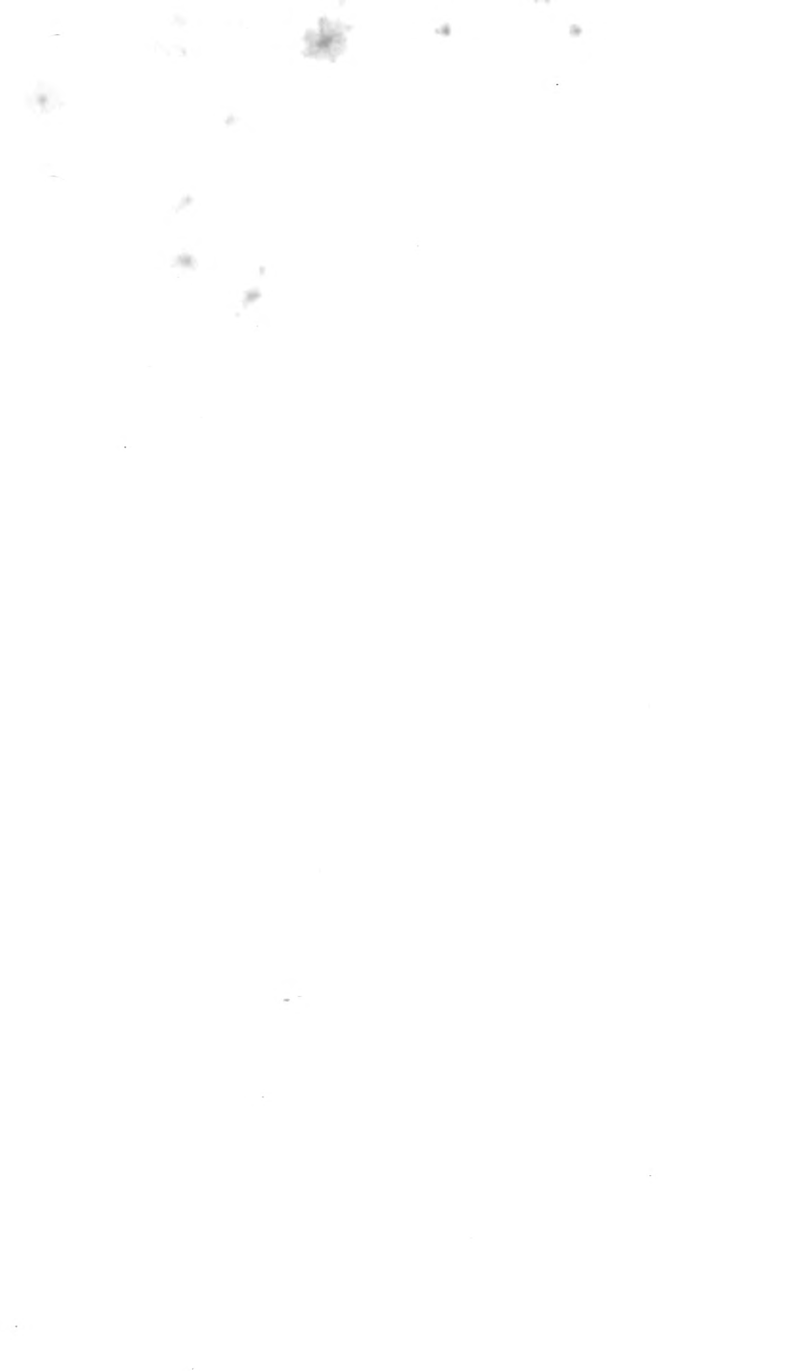
and its undivided, round-headed windows, which amounts to baldness; but enter it, and you perceive that, if the style is severe, the effect is noble and imposing. Disdaining to be decorated, it seeks to be sublime.

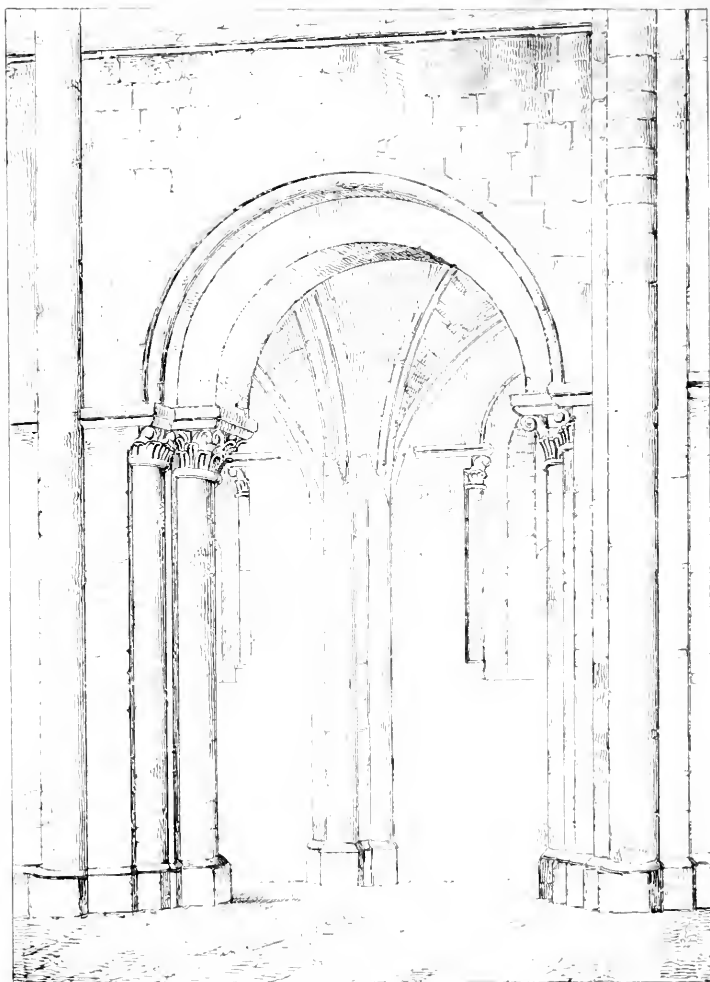
St. Etienne is in the form of a cross. Originally it had three apsises[a]; the principal one, at the east end, which has since been removed; and one in the east side of each transept, both of which remain. Piers, to which half columns are attached, support the arches which divide the nave from the aisles. The half pillars attached to the front of the piers, and which run up to the roof, are alternately single, and in clusters of three. The capitals of the pillars are composed of simple foliage. The apertures of the triforium[b] are circular

---

[a] An apsis is the semicircular recess which invariably formed the east termination of the primitive churches. The primitive churches were copied from the Roman Halls of Justice—at the upper end of which was always a semicircular recess—occupied, in the halls of justice, by the prætor and judges; and, in the churches, by the bishop and priests.

[b] The slope of the roof of the side aisles produces the





Day & Haghe Lithrs to the King

ONE of the ARCHES of the NAVE, CHURCH of St ETIENNE, CAEN

and wide. A double-filleted moulding is carried along the walls below the windows of the Clerestory. The groined roof over the nave is Norman, but may have been added in later times. From the evidence of other churches, it should appear that the Norman architects had not acquired the courage to throw vaults of stone over wide spaces so early as the days of William; and there is something about the small auxiliary pillars which help to support the roof of St. Etienne's, their adaptation and ornaments, which tends to confirm the notion that this stone vault was a subsequent addition.

As you look up the nave, the half pillars attached to the ends of the piers, produce the effect of a long colonnade, terminating with the magnificent arches under the central tower.

---

necessity of a large intervening space between the tops of the arches of the nave, and the windows above, which space is called the Triforium, and is ornamented with a range of pannels or openings. The part above, in which are the windows, is called the Clerestory.

The East end and choir were rebuilt by Simon de Trevieres, who was Abbot from 1316 to 1344[a], but, perhaps to be more in accordance with the simplicity of the remainder of the fabric, this reconstruction is in the style of an earlier period than that in which it was built. The windows are undivided lancets, and exhibit none of the tracery which was habitual in the fourteenth century; but indications of that period may be detected in other parts of this work.

The central spire, which is based on part of the Norman tower, was rebuilt in the fifteenth century; the tower having been greatly damaged when Henry V. besieged Caen in 1417.

The abbey attached to this church was fortified in 1354. After the capture of Caen by Edward III., the inhabitants surrounded the town with new fortifications; but the two great convents, which were situated without the walls, remained unprotected, and, in consequence, obtained leave to protect themselves.

---

[a] Gallia Christiana.

The flat stone which now records the memory of the founder is the third which has been applied to that destination. The first was destroyed in 1562 by the Huguenots, who, in their enmity to the Catholic religion, did infinite damage to the Catholic churches. The second existed till 1742, when the remains of the Conqueror were translated from the centre of the nave into the choir, on which occasion the stone was laid down which is now there.

When William built this church, and resolved to dedicate it to the first martyr, he sent to Besançon, where an arm of the saint was preserved, and obtained a part of the relic.

The convent has become a college.

At no great distance from St. Etienne, now converted into cavalry stables, is the ruined church of St. Nicholas. This church was in progress in the year 1083. By an agreement between King William and the Abbess of St. Trinité, it was made the church of a new parish, to be dependent on

St. Etienne, and served by one of the monks[a]. The nave consists of seven piers with half pillars attached, and as many arches. The pillars have foliage capitals. The aisles are roofed with plain, groined vaulting. The exterior of the apsis at the east end is ornamented with half columns, which run up, at intervals, from the base to the cornice. The cornice, which runs round the church, is a double filleted moulding, with uniform corbels. The west portal is ornamented with a single filleted moulding, and over that, a dented label.

The abbey of the Holy Trinity was founded by Queen Matilda in 1066, and the church was consecrated in the same year.

This church arose at the same time with that of the Conqueror, but its character is entirely different; it is altogether more enriched, probably for the sake of variety in two cotemporary buildings. The west front, a perfect contrast to the bald

---

C. Burton, delt. Day & Haghe, lithogrs.

NAVE OF THE CHURCH OF STE TRINITE, CAEN

London. J. Murray Albemarle St. 1836

severity of St. Etienne's, has a good deal of ornament about its portals, windows, and towers. In the interior, the embattled frette, or à la Grecque, moulding, is carried round the arches of the nave. The piers are narrower and lighter. The pillars at each end of the piers, more lofty and prominent. Their capitals, enriched with different kinds of foliage.

The transept arches, under the central tower, are ornamented with numerous bands of quatrefoils in bas-relief.

Above the arches of the nave, there is a peculiar arrangement. Instead of a deep triforium, here is a light gallery, the small pillars of which, combining with those which support the roof, exhibit a few grotesque figures amongst the foliage of their capitals.

The original east end, which is wanting in the Conqueror's church, here remains entire. It consists of the usual semicircular apsis, and is enriched internally with two tiers of pillars; the lower, large;

the upper, small. Round the windows of the east end, externally, are several mouldings.

Beneath the choir is a large crypt, or subterraneous chapel, supported by a crowd of pillars.

The western towers have a truncated appearance, and are said to have been partly pulled down in 1360[a] by the partisans of Charles the Bad, king of Navarre, who, in those distracted times, had established himself at Mantes, and to annoy the Dauphin, then Regent of France, frequently made incursions into the surrounding country. Charles the Bad remained in that part of France till 1365, when he was obliged to conclude peace with the Dauphin, and received Montpellier in exchange for Mantes.

The convent attached to Matilda's church was assigned to Benedictines of noble birth. The abbess was allowed to fortify this convent in the fourteenth century, and appointed a regular com-

---

[a] Huet, Origines de Caen.

mandant of the fort. The first commandant was a Percy.

The convent has been entirely rebuilt in modern times. It is now converted into an hospital, and the Benedictine ladies have been succeeded by the most respectable and useful of those who bind themselves by religious vows, the Sisters of Charity, who act as nurses, and pass their lives in mitigating the afflictions of their fellow creatures.

The Church of St. Pierre which, as I have already stated, is nearly in the centre of Caen, is remarkable for one of the most successful spires that ever was raised. Important from its magnitude, and beautiful from its lightness, it cannot be seen without being admired, and affords a proof of the advanced state of art in the early part of the 14th century.

The choir and nave of this church belong to the end of the 13th, and the beginning of the 14th, century. The transept was not finished till a century later. The chapels at the back of the

choir, and part of the stone roof were added, or rebuilt, a century later still, under the direction of Hector Schier, an architect of Caen. These portions of the building are finely executed, but very surcharged, and exhibit the rounder forms which belong to the second transition. Here, also, you see one of those attempts to excite attention by novelty, which so often led to the corruption of taste. The last point of beauty having been attained, the next resource is the wonderful. Here, instead of keystones, are disproportioned corbels, hanging down, and looking as if they ought to drop.

The arches of the nave rest on pillars of a very massive character. These pillars exhibit, in the ornaments of several of their capitals, that anomalous mixture of the profane with the sacred, of popular fiction with religion, which was, perhaps, permitted as a mental safety valve in a priest-ridden age. In addition to the usual assortment of ludicrous images of monks and nuns, are represented subjects taken from the old French ro-

mances—Aristotle carrying his mistress on his back, from the Lai d'Aristote; and Tristan crossing the sea on his sword, from the Romaunt de la Rose.

Within the limits of the citadel, the interior of which is now principally grass-plot and trees, still remains, though turned to secular uses, the Chapel of St. Georges, which the Abbé de la Rue supposes to belong to the tenth century. But the earliest historical notice of this building is so late as 1184, when a Court of Exchequer was held in this chapel; and the enriched style of the fabric, especially of the portal, invalidates its claim to remarkable antiquity. All that we know is, that this building was in existence in 1184. The mistake appears to have arisen from confounding this chapel of St. Georges, with the parish church of St. Georges, which parish occupied a part of the ground that afterwards became the citadel[a]. William the Conqueror cleared away the houses,

---

[a] Huet, Origines de Caen.

and was the first who built a castle on this spot, at which he occasionally resided. Henry I. made additions to the castle, and strengthened its walls.

In the villages in the neighbourhood of Caen are several curious ancient Norman churches; indeed in the villages throughout Normandy a surprising number of these very early buildings remain; and in these village churches you frequently meet with that square-ended chancel which soon became the habitual form in England, but which is very rarely found in other parts of France.

At Fresne Camilly, about four miles from Caen, is a church that would be particularly interesting if its date could be ascertained, as it appears to have been built at the very moment of Transition. The work appears to have been carried on with little, or no interruption, yet, part of it is in the round style, and part in the pointed. The interior of the body of the church is in the round style throughout, but there is a series of ornamental pannels, on the outside of the north wall, the tops of which are pointed: even here the dif-

ference is only in the form of the arch, for all the mouldings and ornaments are exact repetitions of those which prevail where the round style is retained.

The chancel is of a later date. It is square-ended, and has early lancet windows.

In the west end is a small round window, the germ of the beautiful rose of after times.

The whole of this church is built in neat courses of stone, with fine joints, and sifted mortar.

We carefully examined the chapel at the bottom of the tower, and the tower itself, but saw no reason for believing these portions of the building to be older than the nave.

From Fresne Camilly we drove, about a league's distance, to Annisy. The road was a narrow lane, never made and never mended, with high banks, and usually trees, on either side. The villages in this district, are very superior to what you expect from the nature of the roads by which they are approached. The houses consist of the fine Caen stone, here used in large blocks, and have a com-

fortable appearance. There is little to remark about the old Norman Church at Annisy, except its very small windows, and its herring-bone walls.

CHAPTER VII.

FALAISE.

At the distance of about seven leagues and a half to the south-east of Caen, exist the ruins of Falaise, one of the very few ancient Norman castles of which any remains are now to be found in a province in which they once so largely abounded. Falaise was one of the strongest holds of the Dukes of Normandy, and the birth-place of William the Conqueror.

Of this castle, considerable remains exist; the principal feature is a large oblong, lofty pile, now a mere shell. This was the keep, which, in Norman fortresses, was not the prison-house, but the fortified habitation of the feudal lord, and contained within its walls room for his family and his

attendants, and all that was necessary to his daily life. The most perfect specimen of this kind of building, is to be found in the Tower of London, in which, part of the second story is occupied by the chapel; whilst the council chamber, which was probably also used as the banqueting hall, is next the roof. On the ground floor are vaulted chambers, which seem to have been dungeons.

The Keep of Falaise is built of large rough stones, with some ashler at the angles, in the buttresses, and about the windows. What there is of ashler is well worked and finely jointed. The workmanship is neater than is usual in the earliest Norman buildings in England, but the walls do not appear to have been much altered or repaired. Two or three of the windows remain. They are plain, two-light, windows divided by a single pillar.

At one angle of the Keep is a lofty circular tower, entirely built of ashler, evidently of much later construction, and attributed to Talbot, whose name it bears.

This Keep is believed to be the same in which William first saw the light. Falaise underwent nine different sieges in subsequent times, but, from the situation of the Keep, it could not have been the point of attack, and always escaped with little injury.

Falaise sustained the greatest damage in 1417, when it was taken by our Henry V., after a siege of three months. It was subsequent to this that Talbot's tower was built.

Falaise is a ruin of a grand, striking character. It stands by itself, at a short distance without and above the town. The Keep is placed on a rocky height, on the edge of a deep ravine. The country in the immediate neighbourhood is varied and picturesque.

For the above particulars, I am indebted to Mr. Hussey, who visited Falaise after I had left Normandy.

CHAPTER VIII.

BAYEUX.—ST. GABRIEL.—CATHEDRAL OF BAYEUX.—THE TAPESTRY.

On our departure from Caen, we proceeded to Bayeux—once a celebrated haunt of the Druids, and afterwards an occasional, and favourite residence of the Norman dukes. The surrounding forests attracted both – the former, in the exercise of their religion, the latter, in that of the chase—but scarcely a tree remains.

Between Caen and Bayeux, near Creuilly, where Robert of Gloucester had a residence, are the ruins of St. Gabriel, a priory, which he founded in 1128[a]. Only the choir of the church

---

[a] At the foot of the Charter, in the possession of the Abbé de la Rue, is a deed of agreement between Robert,

remains, but it well merits attention, as a curious and interesting specimen of the highly florid Norman. Robert of Gloucester, (who was the natural son of Henry I.,) by his marriage with the daughter and heiress of Robert Fitzhamon, acquired the whole honour of Gloucester and large estates in Normandy Eventually, he took the side of the Empress Maud, and during the greater part of the reign of Stephen, took up his abode at Creuilly. During his residence in those parts he became attached to Isabella, sister of Richard de Douvres, Bishop of Bayeux, and by this lady had a son, Richard Fitzcompte, who succeeded his uncle in the See of Bayeux.

Bayeux is now, though large, rather a neglected town, but is embellished by its ancient and noble cathedral. This cathedral has undergone so many calamities, and so many reparations, that it exhi-

---

Earl of Gloucester, and the monks of Fécamp, for the establishment of a Priory at St. Gabriel by the former. The monks of Fécamp had till then an interest in that parish. The deed is dated 1128.

bits every variety of style, from the eleventh down to the fifteenth century.

It was begun in 1047, and the building then begun was consecrated in 1077. But, in 1106, the cathedral was almost destroyed, together with the town[a], when Henry I. assaulted and set fire to the place. To make what amends he could, Henry undertook the expense of the repairs of the church. In 1159 the cathedral was again considerably damaged by fire[b], and Philippe D'Harcourt, who was Bishop of Bayeux from 1143 to 1164, is said to have restored it[c].

He may have done something, but much remained to be done in 1183[d], when Henry II.

set apart the first fruits of the prebends that might fall vacant, for the prosecution of the repairs.

Henry de Beaumont, who was born in England, and became Dean of Salisbury, was at that time Bishop of Bayeux. For the execution of the repairs he contracted with a fraternity of masons who came to Bayeux to fulfil their engagement. Henry de Beaumont died, in 1205, and was buried in the choir, which makes it probable that the choir was finished in his time.

Falling back on the evidence of style, we must believe that the crypt is the only remnant of Odo's cathedral; that the nave, which is in the florid Norman style, is a remnant of the restorations in the time of Henry I.; and that the east end, which is early lancet, is the part which was restored after the fire in 1159, and which was completed before 1205.

---

reficiendam ecclesiam deputandos, quod Urbanus III. ratum habuit vii. idus Octobris." Gallia Christiana.

There is some reason for believing that the two western towers were carried up, perhaps on old foundations, in the middle of the twelfth century, the one by Richard de Douvres, the other by Philippe d'Harcourt, both Bishops of Bayeux, for Philippe d'Harcourt is buried at the foot of the one, and Richard de Douvres, within the other.

The transepts are of a much later date, and cannot be older than the early part of the fourteenth century.

The central tower[a] was rebuilt by Bishop Louis II. in 1479.

Not far from the cathedral is an Hotel Dieu, which was founded by Robert d'Abléges, who was consecrated Bishop of Bayeux in 1206. The interior of the chapel of this hospital presents one of the most elegant specimens of early pointed architecture. The windows of this chapel are lancet, with plain, chamfered, jambs. Robert d'Abléges

---

[a] "Ludovicus II. turrim in medio ecclesiæ construxit 1479." —Gallia Christiana.

was present at the funeral of Philip Augustus. He died himself in 1231.

At the mansion-house we saw the celebrated piece of tapestry, the embroidery of which is ascribed to Queen Matilda, and commemorates the conquest of England. It is a long narrow stripe which unrolls, and exhibits one subject after another, depicted, as has been correctly observed, much in the manner of a girl's sampler. This curious piece of antiquity was kept, till the revolution, in a chest in the cathedral, but the most ancient mention of it only occurs in an inventory taken in 1476 of the ornaments belonging to Notre Dame de Bayeux.

"Item, une tente trés longue et étroite de telle a broderie d'images et éserpteaux faisans représentation de la conqueste d'Angleterre, laquelle est tendue environ le nef de l'Eglise le jour, et par les octaves, des reliques."

The object of this embroidery is to prove that William of Normandy had a better title to the crown of England than the sword. Half the

tapestry is dedicated to events anterior to the conquest. Edward the Confessor is represented explaining to William that he intends to make him the heir of his kingdom. Harold is made to appear in the part of a perjured interloper. But this is the account which is given by all the ancient chronicles, and therefore was not one intrusted to the wife of William alone. There are other objects represented on the tapestry, which throw a doubt on its origin. Escutcheons on shields, which are not supposed to have been introduced so early as the days of the Conqueror, and allusions to Æsop's Fables, which are said not to have been known till translated by our Henry I. At the same time, the veneration in which the tapestry was held is a proof that it was the work of no ordinary hand, and the frequent introduction of Odo, half brother of William, affords strong ground for the belief that it was wrought by one of the family.

The work is highly curious, in point of costume and manners.

CHAPTER IX.

CARENTON.—ST. MERE EGLISE.—MONTBOURG.—VALOGNES.

From Bayeux we went to Carenton, where is a good church with a spire. The style of the church is Norman with alterations in the pointed style. In the nave, are cluster buttresses. Under the tower, arches with deep, and many, mouldings. Pillars, round the choir; pillars, without capitals, but having mouldings at their base. The east end is in the style of the 14th century.

From Carenton we proceeded to St. Mére Eglise, where is another church of the same description. From St. Mére Eglise to Montbourg. Here was an abbey, and its church was of a known and inter-

esting date, as it was consecrated in 1152, but it is totally destroyed. This convent, like many others, was sold in lots at the revolution, to small proprietors, who pulled it down for the value of the materials. Nothing remains but foundations and rubbish, nothing from which a notion of style can be gleaned. It existed in great part till 1817, when it was visited by a Fellow of the Society of Antiquaries of Normandy, who was aware that the buildings would soon disappear, and who, on that account, resolved to preserve what record of them he could. He had three views taken of the church, and has published a description, and history, of Montbourg. From these drawings it appears that the round style prevailed in the architecture of the church, with the exception of the arches under the central tower, and the tower itself. These were in the pointed style, but may have been rebuilt long after the original construction of the fabric.

This church was principally built at the expense of Baldwin de Reviers, Earl of Devon, who,

having embraced the party of Geoffrey of Plantagenet, was obliged to retire into Normandy when Stephen of Blois became King of England. The church was consecrated in 1152, by the Archbishop of Rouen, in the presence of Henry, then Duke of Normandy, and, afterwards, our Henry II.

From Montbourg we went to Valognes. This is an agreeable little town, containing several large houses, each with a court before and a garden behind, which, in France, are considered necessary appendages to the town-house of a gentleman.

Our object in going to Valognes was to communicate personally with M. de Gerville, a distinguished Member of the Society of Antiquaries of Normandy, and one of the largest contributors to its periodical publications. As an emigré, he passed many years in England, where he taught Italian, and studied botany, with all the philosophy of a Frenchman. He is now returned to the enjoyment of his native air, and amuses his leisure with antiquarian researches in the fertile

field of his native province. We found him as obliging, and communicative, as possible, and I take pleasure in availing myself of this opportunity of expressing how much we were indebted to his attention and kindness.

CHAPTER X.

CHERBOURG. — OCTEVILLE. — MARTINVAST. — BRIQUEBEC. — VALOGNES. — LE HAM.

Drove to Cherbourg. The country through which we passed is hilly, well wooded, enclosed, green with pastures, and very like some of the inland parts of England. The trees, on the French side of the channel, seem not to be affected by the neighbourhood of the sea.

Above Cherbourg the cliffs rise abrupt and high. The town is on the flat beneath, a town of no great consequence in itself, but well provided with docks and arsenals.

Leaving Cherbourg, we ascended a long hill, at the top of which we found the village of

Octeville, where is an old Norman church, with a curious octagonal tower. From thence we descended the contrary side of the hill, admiring the woods, and the green slopes, of the surrounding country, and arrived at the village of Martinvast in the valley. A sequestered path led to the church, which stands in a secluded spot, with a fine old yew tree in the little church-yard. The church is early Norman. On the outside of the semicircular east end are slender half pillars with capitals which imitate the Ionic. Under the eaves is a cornice of grotesque heads. The building is lofty within, and vaulted with stone. The arches which support the roof, exhibit the singularity of the horse-shoe form.

On our way back to Valognes, by a different road, but through the same sort of well wooded, diversified, country, we came to Briquebec, where still exist considerable remains of a castle which successively belonged to the Bertrams, the Pagnels, and the Estoutvilles. The castle, which stands at one extremity of the bourg which grew up

under its protection, occupies an elevated situation, and commands a wide range of country. The keep, and the whole circumference of the walls, more or less shattered, remain. The keep is octagonal, and is raised on a mound. In a part of the walls of the court, you see traces of the eleventh century, but the keep is of the fourteenth, and another part is as late as the sixteenth century.

On our return to Valognes we took an early dinner with M. de Gerville, and, after dinner, drove to the village of Le Ham. Le Ham is a retired village amongst trees, adjacent to one of those extensive pastures which are common in this part of Normandy; pastures which support numerous herds, and would be still more useful if they were better drained.

At Le Ham is an old church, of which part is in the round, and part in the early pointed style. Its narrow lancet windows are singularly long, more so than I remember ever to have seen in a building of inconsiderable size. In this church

is preserved a great curiosity which was brought from a neighbouring chapel now destroyed. It is a marble slab, which was once the top of a Christian altar, and which has, on its edges, a very legible inscription of the time of Theodoric, who reigned in the sixth century. The characters are, for the most part, Roman, but exhibit some innovations.

Close to this village is a large old manor-house with a conical roofed tower, which contains the staircase. Many of these old deserted chateaux are seen in this neighbourhood, the proprietors having adjourned to reside at Valognes.

CHAPTER XI.

COLOMBI.—ST. SAUVEUR.—THE CASTLE.—THE ABBEY.—BLANCHELANDE—LA HAYE DU PUITS.—LESSAY.—COUTANCES.

Having received from M. de Gerville a route which was to conduct us to many objects of interest, we engaged a cabriolet for our conveyance, and sent our English carriage to meet us at Coutances, it being wholly out of the question for any carriage on springs to attempt the cross roads which it was necessary for us to encounter.

Leaving Valognes, we had a good road for the first three leagues, as far as St. Sauveur le Viscompte. The only remarkable object which we saw on our way was the handsome stone church of Colombi, with still more singularly long lancet windows than those at Le Ham.

After ascending a long hill we enjoyed a commanding view of St. Sauveur, and the dismantled castle and ruined abbey, which give it consequence. These interesting remains are situated, at no great distance from each other, on the edge of a slope which descends to a green expanse intersected by a narrow, winding, river.

The castle of St. Sauveur was originally built, in the early part of the tenth century, by one of the Norman captains to whom Duke Rollo assigned the district as a reward. In the family of this captain it remained till the twelfth century, when it passed by marriage to the Tessons. About the close of the same century, the heiress of the Tessons gave herself and the castle to a D'Harcourt. Geoffrey D'Harcourt, in 1328, made the castle a formidable fortress. On the death of Geoffrey, Edward III. of England gave St. Sauveur to the celebrated Chandos. After a variety of fortunes the castle is at last become an hospital.

The remains are considerable,—walls, gateways, and towers. The principal feature is a large square

tower, which was built by Chandos, who also built one of the gateways.

After visiting the castle, we walked through the Bourg, in which are a few houses of a better sort, inhabited by provincial gentry, amongst whom is still to be found an Abbé de Perci, a descendant of the Norman branch of that family which has become so illustrious in England. It was striking to find this remnant of a noble line, after the lapse of so many centuries, still in existence on the native soil.

At two leagues distance from St. Sauveur is the hamlet of Pierrepont[a], the cradle of another ennobled English family. Remembrancers of this kind abound in Normandy, and give its old castles and abbeys a peculiar interest in the eyes of an Englishman. Every thing in that country is connected with the history of his own, and

---

[a] Pierrepont derives its name fron a stone bridge with which Charlemagne supplied the place of a ferry, and which, in his days, was considered a great achievement.

even with families of whom he has heard all his life.

From the Bourg we walked to the Abbey.

The conventual buildings are still entire, but in the possession and occupation of different individuals, and in wretched condition.

The church is in ruins and will soon disappear. We saw the farmer, the present proprietor, standing on its walls with his men, and in the act of throwing down the stones for common use.

This abbey was founded by the Tessons, when lords of St. Sauveur. The abbey was begun in 1067. The church was not consecrated till 1160; and not finished till the first half of the thirteenth century, when it was completed by the Harcourts, whose arms appear on some of the key-stones of the southern transept. Hence it will be seen that two hundred years elapsed between the commencement and the completion of this building; a circumstance of by no means uncommon occurrence, but one which has often led to erroneous conclusions. From the apparent improbability

of such long interruptions in the progress of such undertakings, a date has often been attributed to the more recent part of the fabric, to which that part has, in fact, no pretension.

As high as the summit of the Triforium the round style prevails throughout this building, except in the choir, the whole of which is evidently a later work. *Above* the Triforium, all is pointed, and this must have been a part of the work of the Harcourts in the thirteenth century.

This church was much injured in the fourteenth century by John Chandos, who ordered it to be dismantled lest the enemy might turn it to account. It was repaired in the fifteenth century. The reparations are easily traced by the difference of style.

The church is beautiful as a ruin, but of no value as bearing upon the question of the pointed style, for as it is known to have received additions, and undergone reparations, after the time when the pointed style was universally introduced, we

cannot refuse to accept so obvious a solution of the problem.

Leaving St. Sauveur, we passed through a fine, cultivated, and well-inhabited country, but got amongst detestable roads. We could hardly believe our guide when he pointed out to us, as the road we were to travel, what appeared to be a ditch, with high banks and overhanging trees, yet down the ditch were we obliged to go. The roads in Normandy bear no relation to anything else. They are a century behind all you see about them, and around them. The fields are well cultivated; the villages well built; there are many scattered farms. Every thing bears the mark of industry and neatness, and you only wonder how so advanced and civilized a population can endure the almost impassable roads by which their carts, their horses, and themselves, must be shaken to pieces.

Turning up a lane, to visit the ci-devant abbey of Blanchelande, we literally stuck fast. In vain

the voice was exerted and the whip applied. We were obliged to get out and walk. Hoodwinked, for some time, by hazels and other trees, which met over our heads, we finally came to a common, on high ground, from whence we had a splendid view of the Bourg and castle of La Haye du Puits, an extensive range of hills, much pasture, much hedge-row timber, and many distant churches. Having crossed the common, we struck into another shady lane, passed through a wood, and soon broke upon a green sequestered valley, very like an English scene, with its trees and its verdure. On the further side of the valley, screened from the north by rising ground, and washed by the clear waters of a nameless stream, stand the remains of Blanchelande. The abbot's house, which the bishops of Coutances formerly used as a summer residence, is still in tolerable repair, having become the habitation of farmers. The elder members of the family had known the abbey in its better days, and threw a little sentiment

into their history of the former proprietors of the place.

The greater part of this church is gone, and much of what remains is reconstruction. It consisted of a nave, without aisles. Against the walls, on each side, are pilasters with three half pillars attached, which are carried up to support the roof. The original parts of this church are in the round style, though the vaulting, of which remains exist, appears to have always been pointed. The capitals of the pillars, and the mouldings, are all late Norman.

The tower must have been entirely rebuilt, and the west portal inserted, at a far later period.

The church was consecrated in 1185. Richard de la Haye, lord of the adjacent burgh of La Haye du Puits, and a favourite of our Henry II., conjointly with his wife, Matilda de Vernon, founded this abbey in 1155, and erected the buildings at his own expense. Richard did not live to see the accomplishment of his undertaking, dying in 1169.

But his widow, who survived him forty years, completed the work.

The life of Richard de la Haye was chequered with such adventures as, in those days, were ordinary occurrences, and are now the stock in trade of the writers of romance. Refusing to swear fealty to Geoffrey, Count of Anjou, who invaded, and obtained temporary possession of, Lower Normandy, Richard de la Haye escaped on board a vessel, which was captured by Corsairs, and, for many years, underwent the greatest hardships. Perhaps he founded Blancheland in grateful recollection of his deliverance from slavery, and his safe return to his native land.

From Blanchelande we walked down to La Haye du Puits, and visited the ruins of its castle, which stands on a mound. A young farmer, its present proprietor, acted as our guide. He had pulled down the greater part of the castle, and told us he meant to do the same by the rest, and sell the stone to mend the roads. We could not say that the roads did not want mending, but we regretted

that the castle was to supply the materials. One fine old, machicolated, tower still remained, but is probably gone by this time, and La Haye du Puits, deprived of its ornamental features, must be content to become an unmarked and obscure little town.

Amongst the foundations of the castle we observed some large square blocks of stone, which appeared to be Roman work.

This castle belonged, in the middle of the eleventh century, to Turstin Halduc, the founder of the abbey of Lessay. His son, Odo, was seneschal to William the Conqueror. The castle subsequently passed into various hands, the domestic part of it was rebuilt in the latter part of the sixteenth century. This part still exists, and, at the time of the Revolution, was the property of the Marquis de la Salle.

Our cabriolet, having been helped out of its difficulties, met us at La Haye. Resuming our seats, we drove on to Lessay, where the abbey and its church still remain, nearly intact. This abbey

is less pleasantly situated than most religious houses, being placed on the edge of an extensive flat of marshy meadow.

This church is a fine specimen of the Norman style. It is of one character, plain, but grand, throughout; and possesses a noble central tower. The western portal is more ornamented than the other parts, and exhibits the dog-tooth moulding, which does not occur in England till nearly the end of the twelfth century. The arches of the nave rest on piers, in the four recesses of which are half pillars. The roof is of stone, and original over the choir and a part of the nave. Over the remainder of the nave is a vault of later date, which has ribs with mouldings and key-stones. The arches of the Triforium are divided by a small pillar, and this part of the building is an exact counterpart of Fécamp, with the single difference of the shape of the arch.

What part, whether any part, of the existing church of Lessay is really the work of Turstin Halduc, is very uncertain. The arrangement of

the pillars which run up to the roof, the stone vaulting over the nave, and the western portal, are all indications of later times; and, through the obscurity, which hangs over the annals of Lessay, traces of events are visible which give the notion of extensive destruction, and extensive restoration. These annals state that Lessay more than once suffered from the violence of the times, through hostile attacks, and by fire. They also record a consecration in 1178, fresh injuries by the English in 1356, and fresh reparations in 1385, which were only completed in 1447[a].

The consecration in 1178 may denote the completion of the almost total reconstruction of the Norman part of the fabric, whilst the injuries and repairs in the fourteenth and fifteenth centuries account for the different character of half of the vaulting over the nave.

From Lessay we proceeded slowly to Perriers, and there, to our great relief, joined the high road, along which we advanced, at a better pace, to Coutances.

---

[a] Neustria Pia.

CHAPTER XII.

CATHEDRAL OF COUTANCES.

THE cathedral of Coutances is one of the buildings which, from the date assigned to it by the Norman Society of Antiquaries, has excited so much sensation, surprise, and discussion.

There is no doubt that, on the spot where the cathedral now stands, a new cathedral was begun by Bishop Robert in 1030, which was finished by his successor Bishop Geoffrey de Moubray, and consecrated in 1056; and the Norman Society of Antiquaries assert that the greater part of the existing building is the work of Bishop Geoffrey; in other words, that the pointed style was adopted in France one hundred and thirty years before it appeared in England, and nearly as much before it appeared any where else.

Coutances, which is only four miles distant from the coast, shared the fate of so many of the towns of France, and was almost destroyed by the Normans in the ninth century. A century and a half elapsed before any attempt was made to raise it from the dust. At length Robert, bishop of Coutances, began the restoration of the church, but it was Geoffrey, his successor, a man of high birth and equally distinguished for his abilities and his virtues, who devoted himself, heart and soul, to the pious work. In his undertaking he was largely assisted by the Norman barons, and particularly by Tancred de Hauteville and his six sons, who, born within the diocese of Coutances, had effected conquests in Apulia and Sicily, that appear like the fictions of romance, and who, at the earnest solicitation of Geoffrey, sent a liberal portion of their Italian spoils to advance the restoration of the Norman cathedral. The cathedral was consecrated in 1056, in the presence of William, duke of Normandy, nine years before he conquered England.

These are admitted facts, and have enough pomp and circumstance about them to make any one wish to believe that they belong to the fabric which is still before our eyes.

But what is the style of the architecture of this fabric? Does it resemble the buildings which, in 1056, and for above a century afterwards, were constructed in that country? Does it resemble St. Stephen's of Caen, as the presence of William at its dedication might lead us to expect? Does it resemble any building which at that time had made its appearance in any part of the world?

On the contrary, it is altogether in the advanced pointed style, with reparations of a later date.

It is a fine edifice, large in all its parts, and lofty, ornamented but not surcharged. Its two western towers, terminating in spires, are unusually high and beautiful, and, for a wonder, are both finished and alike. On either flank rise a crowd of pinnacles and pyramids, and, on one side, in an elevated situation, are seven niches, which, till the

Revolution, held the statues of Tancred and his six sons.

The interior is remarkably lofty, above an hundred feet from the floor to the key-stone of the vault. Cluster piers support the arches which divide the nave from the aisles; coupled pillars surround the choir. Most of the windows are of a later date than the body of the building.

At first sight, then, we cannot but come to the conclusion, from the certain evidence of construction and style, that the cathedral now existing at Coutances is not the one which was consecrated in 1056. Had it even been a transition church, had any thing like it existed at the time in any other country, we might have admitted a doubt, but it is impossible to believe that the pointed style should have broken forth at once, at this spot, in all its perfection, and without having produced any effect on the architecture of the country for above a century afterwards.

Let us now enquire what light is thrown upon

this subject by the few and faint records which have come down to our times.

The Livre Noir of the Chapter of Coutances (so called from the colour of its binding) is the document to which the French antiquarians refer, and upon which they ground their hypothesis. This Livre Noir was compiled by order, and under the eyes, of John D'Essaye, who was elected Bishop of Coutances in 1250, and as its pages contain nothing about any alterations in the fabric, it is brought forward as a proof that no alterations could by possibility have taken place. The Livre Noir is now lost, but the Abbé Toustain de Billy, in his Histoire du Diocése de Coutances, expressly states what its contents were, and from this source, as well as from the Gallia Christiana [a], we learn that that part of the Livre Noir which

---

[a] "Coram eo confectum, seu potius inchoatum 1251, Regestum de Patronatibus Ecclesiarum Diœcesis, ab integumento postea dictum Liber Niger."—Gallia Christiana.

was compiled under the eyes of Bishop John D'Essaye, was nothing more than *an account of the advowsons of the diocese, and their value in* 1252,—nothing more than a Terrier,—and, whatever architectural operations might have been accomplished or in progress, is it probable that any notice of them would be found in a document dedicated to quite another purpose? The silence, therefore, of the Livre Noir proves nothing. Let us now see what information can be obtained from other sources.

There exists nothing to show what were the fortunes of the cathedral of Geoffrey up to the time of John D'Essaye. It may, or may not, have remained intact till then. But, from inscriptions still legible on the walls[a], it appears that John D'Essaye him-

[a] "Hanc Capellā dotavit: Joh: de Eēīō. Epc̄: ɔst̄: ī: honore Sc̄i Georgii." is the inscription in the second chapel; a similar inscription consecrates the third to St. Martin, the fifth to St. Bartholomew, and another to St. Andrew. These inscriptions were observed, and copied, by Mr. Gage.

self endowed four, if not all the six, chapels on the north side of the nave, and his endowing them almost certainly implies that he built them. There is also reason for believing that he rebuilt, or finished the reconstruction of, the choir, because he lies buried in the middle of it, and (with a single exception of so late a date as not to bear upon the present question) John D'Essaye is the only bishop buried[a] in that part of the church; a distinction which in ancient times was the usual reward of the builder. Here, then, are proofs of considerable alterations, at least, in the second half of the thirteenth century, and if the whole of the cathedral was not rebuilt at that time, historical notices remain to point out the period when other alterations took place.

In the year 1356, soon after the battle of Poitiers, Geoffrey D'Harcourt came with his army to Coutances, took possession of the town, and laid

---

[a] He died in 1274.

siege to the cathedral, which had been garrisoned and resisted his summons. A French army drove him away before he had effected his purpose, but not before "*la dite Eglise avoit été moult endommagée par le siège que nos enemies mirent devant notre dite Eglise, qui lors étoit forte, et par les pierres d'engin qu'ils jetterent.*" The writer adds that the cathedral was damaged "*au point d'être en voie de chéoir en ruine.*"[a]

From the serious nature of the injuries which the cathedral received in 1356, it must have undergone repairs and alterations of importance enough to account for the disappearance of all remaining traces, if any remained, of the original work.

The troubles of France, and of Normandy, for some years interfered with so great an undertaking as the reparation of this cathedral; but in the year 1371, Sylvestre de la Cervelle was

---

[a] Histoire MS. de Coutances, par M. Demont.

made Bishop of Coutances, and in the same year Charles V. granted him a large sum towards the prosecution of the work [a]. Some years afterwards Sylvestre addressed a brief to all the parishes in his diocese, beseeching them to assist the work with their contributions. Sylvestre incessantly urged on the repairs to the day of his death, and in the year 1387 [b] was buried in the Lady chapel which he added at his own expense.

The reparation was in hand for some years longer [c]. An Act of Charles VI. is preserved, in which he grants the chapter of Coutances certain indulgences in consideration of the expenses they had sustained in the repairs of the cathedral, and, by a decree of the chapter of Coutances [d], in the year 1402, it appears that the work was not completed at that time.

[a] Gallia Christiana.

[b] Gallia Christiana, Tom. XI., col. 887.

[c] Histoire des Evéques des Coutances.

[d] Histoire MS. de Coutances, par M. Demont.

The miracle, therefore, is a dream, and the existing cathedral belongs partly to the second half of the thirteenth century, and partly to a period by more than a century later than the above-mentioned time.

CHAPTER XIII.

HAMBYE.—ABBEY OF HAMBYE.—GAVRAY.

May 25.—This day was devoted to an expedition to the Abbey of Hambye, which is about thirteen miles distant from Coutances.

Soon after leaving Coutances, on descending an hill, we caught a fine view of the town and its cathedral. Coutances stands on an eminence, and the cathedral, placed on the highest point, towers magnificently over the city which surrounds it. The country in the neighbourhood is agreeably diversified, sufficiently clothed with trees, and generally green—very like England.

The whole of the road was so desperately bad that we were continually obliged to get out and

walk. The country was always fine—the fields well cultivated, the houses substantial—every thing good but the road.

At length we came in sight of the remaining tower of the castle of Hambye, which stands on an eminence, surrounded by deep valleys. Hills and wooded banks appear in the distance.

This castle belonged to the family of the Pagnels, a branch of which settled in England, and added its name to the town of Newport, in Northamptonshire.

The remaining tower of the castle is of late Norman architecture.—This tower will soon share the fate of the remainder of the castle, and be levelled with the dust.

Leaving our cabriolet at the little inn of the Bourg, we walked on to the abbey, which is about half a league from the village.—After a long ascent, and a long romantic lane, we entered a wood, emerging from which we found ourselves on the top of a ridge, looking down upon another beautiful valley, or rather glen, of which the steep

banks are varied with copse and crag, and watered by the little river Sycnne, which hurries and winds along the bottom. Descending through the wood, we soon caught a glimpse of the ruined church of the abbey, which stands in a sequestered nook, at the foot of the cliffs, between the rocks and the stream. It was impossible not to be struck by the contrast of the situation of the castle and the abbey, the one on its proud elevation, the other in its tranquil seclusion; each so appropriately placed.

The church of this abbey is only sufficiently ruined to be very picturesque. It consists of a nave, without side aisles, of transepts, an insulated choir, and chapels behind the choir. The nave is long and rather narrow.—Its walls, for the roof is gone, are unusually high; the arches under the tower, proportionably elevated. These arches rest on four large octagonal buttresses. The only windows in this part of the church, are lancets, singularly long.

The choir is surrounded by pillars, which support very narrow arches. The capitals of these pillars are ornamented with foliage of good design and execution.

The arches which form the entrances into the chapels behind the choir, are round. At the end of each transept is a large pointed window. The windows of the tower are round-headed, with pointed divisions. The west end is entirely gone. Plain flying buttresses are attached to the outside of the choir.

Much of the habitable part of the convent remains, together with a portion of the cloister, of which the arches are round, and appear to be the oldest part of the existing buildings.

The gate-house, also, remains, which has two arches; both obtusely pointed. Over the larger arch is a label ornamented with the nail-head pattern.—The dog-tooth pattern appears on the moulding of the other.

This abbey was originally founded by William

de Pagnel, the proprietor of the castle on the hill. He signed the act of foundation in 1145[a], in the presence of Algare, bishop of Coutances, and others.—But the annals of Hambye are more loud in the praise of Johanna de Pagnel, whom they represent as having built the convent and the church, in the early part of the fifteenth century. This, however, must have been a reconstruction. A convent and a church, no doubt, arose soon after the foundation, but, in the course of nearly three centuries, may have fallen into a state of decay, or suffered from the violence of the times. —The truth seems to be that Johanna de Pagnel, either entirely, or in a great measure, rebuilt the fabric which at present exists.

The style of the fabric has, in general, a character anterior to that of the fifteenth century, and some portions of it, as the entrances into the chapels, and the cloisters, being in the round style,

---

[a] Neustria Pia.

are, it must be owned, rather perplexing anomalies—but portions of the old building may have been preserved, of which the cloisters are, probably, a part,—and a fashion rather older than that of the day may have been adopted, as was sometimes done, to be more in harmony with any portions of the old building that may have been retained. We have only to choose between the twelfth and the fifteenth centuries—and we cannot doubt to which of those periods the bulk of the existing fabric belongs.

Joan de Pagnel was the last of her line, and carried the estate into the house of the D'Estoutevilles. Her husband, Louis D'Estouteville, made a gallant and successful defence of Mont St. Michel against the English in 1424. They were both buried in the choir of the church of Hambye, where their tombs existed till the revolution.

At a short distance beyond the abbey is a bridge over the river, beyond which the road divides, and conducts, one way, to Gavray, and the

other way, to Perci, the cradle of the dukes of Northumberland. Perci is about three leagues distant from Hambye.

Returning to the Bourg, we resumed our seats in the cabriolet, but soon had to abandon them again, and walk the whole way, two leagues, to Gavray. The lanes were picturesque, and there was much beauty in the surrounding country. We passed through the village of St. Denis, and saw, with some surprise, many comfortable houses, and even good shops, in a place almost inaccessible on wheels. At length we arrived at Gavray, a small town on the river Syenne. Gavray is scattered along the base of an eminence on which once stood a castle, and from whence there is a splendid view.

At Gavray we rejoined the high road; consequently, were able to re-establish ourselves in our vehicle, and mend our pace. We did not, however, effect our return to Coutances till twelve at night.

CHAPTER XIV.

ST. LO.—THE CATHEDRAL.—CHURCH OF ST. CROIX. —CHURCH OF ST. THOMAS OF CANTERBURY.— CERISY.

May 26.—Coutances is advantageously situated on an eminence, and commands a varied and agreeable country. It is only four miles distant from the sea, but is debarred of the sight of it by intervening hills. The present town is but a shadow of its former self, and the magnificent churches have little relation with the forlorn houses by which they are surrounded. There is no trade to give life and prosperity to the place, but even here are extensive public walks. No town of France is without public walks, which are a source of health and enjoyment to the people. How

surprising that nothing of the sort should yet belong to any one of the provincial towns of England!

Leaving Coutances, on our way to St. Lo, we passed through a varied and agreeable country, abounding in woods, orchards, pastures, hedges, and hedge-row trees. In the church of the village of St. Giles, we observed many of the peculiarly long lancets.

The town and cathedral of St. Lo have a strikingly fine appearance as approached from the south. The greater part of the town stands on an eminence, surrounded on three sides by a ravine, through which runs the river Vere. The cathedral is placed nearly at the edge of the height—a Durham in miniature. Such situations have often fallen to the lot of cathedrals, because originally, as in the case of St. Lo, they were the chapels of castles. The castle, for obvious reasons, was built on the height; the chapel was its necessary appendage. In altered times the feudal fortress disappeared, and the chapel, rebuilt in a more

ambitious form, became the sole possessor where it was once the humble attendant.

St. Lo is a town of ancient celebrity. The strong position, which nature had provided here, originally tempted Charlemagne to construct, at this place, a provincial bulwark. At the same time he founded the church and convent of St. Croix, without the walls of the fortress. The whole place, in consequence, at first obtained the name of St. Croix. In after times, however, the local veneration for St. Lo changed the first name of this place into the one it now bears. St. Lo, or Laudus, who lived in the sixth century, was a native of this part of Normandy, and, though a great landed proprietor, took orders, became bishop of Coutances, and left his estates to the church. The veneration for the Saint increased as centuries rolled on, and his name finally triumphed even over that of St. Croix.

In 890, the Normans took and totally destroyed the fortress and the town. Some places were longer than others in recovering from the effects

of this visitation, and a century elapsed before any attempt was made to rebuild the town and walls of St. Croix. So completely had the towns been destroyed, in this part of Neustria, that the Bishops of Coutances, after the Norman conquest, resided either at Rouen or Bayeux till the year 1025, when Robert, Bishop of Coutances, to place himself more in the neighbourhood of his duties, established his residence at St. Croix. There abiding, he began to restore the town and the walls, and also begun a new cathedral on the spot where the chapel of the fortress formerly stood. This cathedral was, at a later period, totally replaced by another fabric, in the pointed style, which was consecrated in 1202, but which has undergone many alterations. It is a spacious building, with two handsome towers, terminating in spires. The nave, and one of the towers, in style resemble that of our Edward the First; the other tower was added, or finished, in 1464, at which time the great portal was finished as it now appears. Though there is a general resem-

blance in the style of the French churches to that of the cotemporary churches of England, yet there is much dissimilarity in the details; in the mouldings, which, in France, are less bold and projecting, and in the ornaments which, in design, are more studied imitations of the Roman.

From the brink of the eminence on which the cathedral stands, the *look down* upon the valley and the river is beautiful.

From the cathedral we went to the Church of St. Croix, which is at a considerable distance, at the opposite extremity of the town. The convent is turned to secular purposes, but the church still remains, and this church the French antiquaries would fain believe to be the one built by Charlemagne. There is, at this moment, an indescribable anxiety in France to establish the existence of something Carlovingian in that country; and it is somewhat singular, that in a country where that great restorer of churches is known to have built so much, not a vestige should remain which

can with any certainty be ascribed to his time. The church of St. Croix is of no assistance, for, though it is certainly impressed with the character of great antiquity, yet so exactly does it correspond with the style of the eleventh century, and so little with the few specimens which exist, in other countries, of the eighth, that the building itself teaches us to reject the improbable hypothesis of its having escaped the Norman storm. When we know that the Church of Charlemagne was situated *without* the walls; when we know that the fury of the Normans, then Pagans, was chiefly directed against Christian temples; when we know that the fortress itself and the whole town were destroyed, and remained for above a century in ruins,—can we believe that a particularly distinguished, and particularly unprotected, church, should alone have escaped? Must we not conclude that this church rose again from its ashes, with the remainder of the town and the cathedral, in the early part of the eleventh century?

It has some peculiar features. It is not of large dimensions. The round arches, on each side the nave, are supported, not by piers, but pillars with foliage capitals, rudely imitating the Roman. One side of the nave differs from the other. The south side is much the plainest; and its cornice is only a series of blocks, whilst that of the north side consists of an elaborate Norman ornament. Such discrepancies are, however, frequently found, and only prove that the building was not constructed at once.

The west entrance is barbarously adorned with a grotesque group, in high relief, which represents the Subjugation of the Evil Spirit.

There is a cornice of monster-heads under the eaves.

In another part of the town is a building, now la Halle au Bled, which, before the Revolution, was a church dedicated to St. Thomas of Canterbury.

The original church was finished in 1174. It was in progress when Thomas à Becket, having

incurred the resentment of Henry, went abroad and passed through St. Lo. There was a dispute at the time to whom the new church should be dedicated. The illustrious stranger was consulted, and his reply was, "let it be dedicated to the first saint who shall shed his blood for the Catholic faith." Providence allowed it to be dedicated to himself. He was murdered in 1171, and canonized in 1173. The original church, however, was pulled down in 1571, to make room for improvement in the fortifications, and rebuilt, in its present situation, in 1630.

The town of St. Lo is very much scattered. On one side it has extended over the opposite bank of the ravine. Near the centre of the town, but with an ample space around them, are a new Préfecture, and Palais de Justice.

From St. Lo we made an excursion of about four leagues and a half, to Cerisy. At this place was one of the great abbeys of Normandy. The abbey church, now become the church of the

parish, still exists, and is a most interesting specimen of the severe, but grand, style of the early Normans.—Cerisy is so near a resemblance of the old part of St. Etienne's of Caen, that it might be described nearly in the same words. Cerisy consists of a nave with side aisles, transepts, a semicircular chancel, and a central tower. The arches of the nave rest on piers and half columns.—Above these arches is a deep triforium. The capitals of the pillars are formed of foliage, amongst which appear a few animals, and small heads,—but hardly any ornament is admitted in any other part of the building.

The transepts are parted off from the nave as at St. Etienne's, and St. George de Boscherville. Here the original chancel remains, and is ornamented, internally, with pillars,—half pillars are introduced on each side of the windows. The upper tier of windows is pointed, and, with the groined vault, must have been an addition. The nave of Cerisy never acquired a stone vault;

it is still a roof of wood, and this fact makes it still more probable that the stone vault of St. Etienne's of Caen was not coeval with its walls.

Cerisy was founded, in 1030, by Robert, Duke of Normandy, who, going to the Holy Land, (where he died,) left the church incomplete.—It was finished by his son, William the Conqueror.

The façade is modern, and the nave is reduced in length; alterations having been made in this part of the building, in the fourteenth century, when the monks added a second church, in front, to form a separate church for the parish, as was not unusual. This second church was damaged by lightning in 1812, and taken down the following year.

CHAPTER XV.

TORIGNY.—VIRE.—MORTAIN.—THE CASTLE.—THE COLLEGIATE CHURCH.—L'ABBAYE BLANCHE.

As the next object of our researches was Mortain, we took the nearest road from St. Lo to that place.

The country through which we passed was of the same character, varied with hill and dale, and enriched with verdure, orchards, and hedge-row trees.

The first place of any consequence at which we arrived was Torigny, which stands on high ground. On an eminence, in the centre of the town, with an open space in front, stands the *ci-devant* French residence of the princes of Monaco. It had a large park at the back, and

once looked over terraces, lawns, and groves, but it is now half pulled down, and converted into a maison de ville. A new public road has been conducted through the park.

At Torigny, the Church of St. Laurent is early Norman, and that of Notre Dame preserves a few traces of Norman, amongst which is the cone moulding over one of the doors.

The stage between Torigny and Vire is hilly, but the country is rich, and often beautiful, especially when you descend into, and cross, the narrow valley of the river, on either side of which are craggy steeps, fringed with brushwood.

Vire is a picturesque old town, standing on an height, which, surrounded on three sides by deep ravines, afforded a strong position for a castle. At the extreme angle of the height, the fortress rose supported on rocks, and of this fortress the Norman keep and a few walls remain. As we returned from this spot, we passed through a narrow, winding, half timber, street, terminated by

an arch surmounted by a clock-tower. This street would have made a good subject for Prout, and the high, white, Cauchoise head-dresses of the women, relieved the dark recesses of the picture in the manner of which that admirable artist so well knows how to avail himself.

After Vire, we passed through the same sort of hilly country, along a finely conducted road, enjoying agreeable views, till we reached the object of our immediate destination.

The situation of Mortain might be described nearly in the same words as that of Vire, but, in nature, there is always a variety, though words are not always able to make the distinction perceptible. Another jutting height here afforded opportunity for another castle, and the town drew near it for protection. The leading features of both places are the same, but the scenery of Mortain is more beautiful. The valleys are narrower, the steeps more rocky, and better wooded; the river, at the bottom, is more considerable, and a wide extent of distant Campagna is seen through

the jaws of the ravine. The whole scene put me in mind of Italy, and of Tivoli; and the cascades, which we heard from above, and visited, afterwards helped to keep up the resemblance.

You *descend* to the site of the castle; but, when you arrive there, you find it a most suitable spot for an eagle's nest. A jutting cliff, only connected to the height by a narrow ledge of rock, afforded just space enough for a feudal fortress. The strength of this fortress made it once a place of importance. Here dwelt the brothers, and the sons, of kings of England. But only one tower of their castle survives, and a modern house and its appendages disfigures the remainder of the site.

The celebrated collegiate church stands in the town, at a short distance from the castle. How long had I wished to see this building! How much light had I expected it to throw on a long disputed question! But that elusive object, the origin of the pointed style, vanishes whenever you think you are approaching it.

The Norman Society of Antiquaries ascribe to this church in the pointed style the date of 1082, and wish you to believe it to be the same church which was built by Robert, Count of Mortain, who was a brother of William the Conqueror. But what is the style of this building, which, if admitted to be what it has been represented, would throw the introduction of the pointed style a century farther back than has ever been imagined? Does it contain the traces of a style in its infancy?—of that struggle between the two styles, that mixture of round and pointed forms, which is universally found not less in France, and in this part of France, than in other countries, in all the early specimens? On the contrary, with the single exception of one portal, (of which more hereafter,) the church of Mortain is in one style throughout, and that, the confirmed pointed:—arches, windows, doors, all are pointed. Evidently anterior to Coutances, Mortain is no less evidently of a later date than the eleventh century. In style it more resembles the buildings of our Henry

III., (who began to reign in 1216,) than English buildings of any other period.

The church exhibits some of those varieties which distinguish the pointed architecture of France from that of England, and possesses some peculiar features. Unlike the churches of Normandy, and only like those of Italy, it was originally built without a tower. It has no transepts. Its arches rest, not on piers, but pillars. Its capitals, mouldings, and ornaments are the same with those which are found in the Norman churches in the round style, and, so far, afford a proof of its having been constructed before the new fashion had affected every part of the fabric.

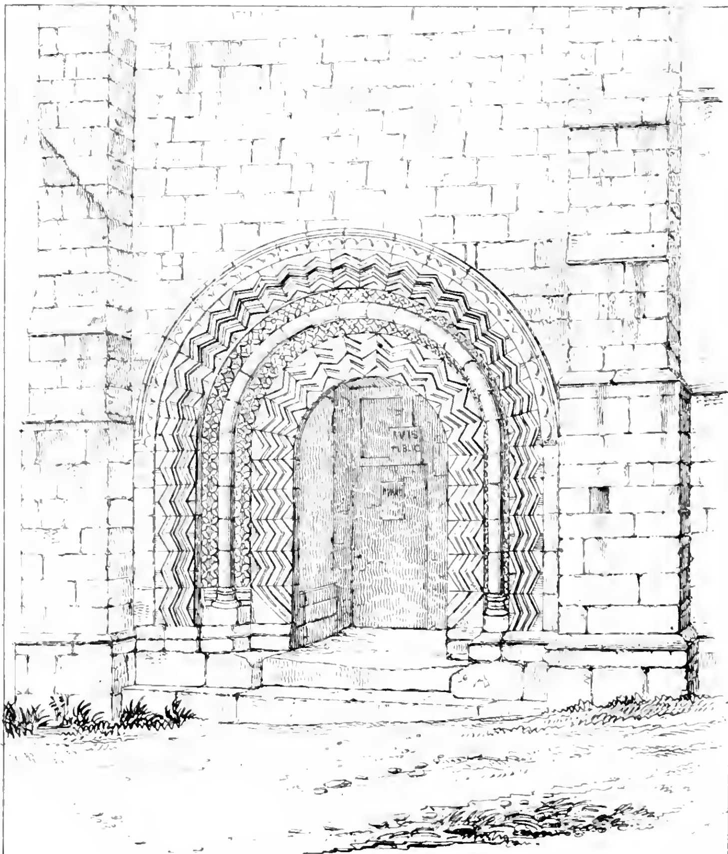
The pillars of the nave, which go forward to encircle the choir, are thick, and rather short, with large Norman capitals, ornamented with an imitation of leaves. The arches of the nave are wide; those of the choir, remarkably narrow. All the windows are lancet. A few of them, rather obtuse. Externally, the windows have slender, re-

cessed Norman pillars, with capitals, on either side.

The great western door is pointed. The pillars, at its sides, are of short proportions.

The whole building is constructed with ordinary sized blocks of ashler. The joints are rather wide.

The church has now a tower, not at the side of the west end, but of the east; and there is the base of another tower on the northern side, which was meant to correspond. The finished tower is singular, having long narrow slits, rather than lancets, in its sides, almost from the top to the bottom. But this is one of those capricious varieties which prove nothing as to date. The tower must have been an after-thought, because the tower and the church are not bonded together, and because the tower abuts upon one of the windows. There is also an half arch in the tower wall, which seems to have been intended to prevent this invaded window from being blocked up.



Day & Haghe lithog^rs

SOUTH DOORWAY, MORTAIN CHURCH

London, J. Murray, Albemarle St. 1836

The door, which differs in style from the rest of the building, is on the southern side. It is large, round headed, and enriched with the usual Norman mouldings. The discordance in style of this door would be more unintelligible, if you did not at once perceive that the door could not have been constructed at the same time with the remainder of the building; for the wall which contains the door, is much thicker than the walls of the remainder of the church, and is spliced to the thinner wall in a clumsy manner. In addition to this peculiarity, the two cluster columns, on either side of the door in the interior, are left incomplete, to leave room for the door. One of the shafts of each cluster (the one that would have stood *next* the door, but, if it *had*, would have *lapped over it*) is omitted.

There is but one way in which the discrepance between the door and the church can be rationally accounted for; the door must be a remnant of the church which was built in 1082, and the existing

church must have been entirely reconstructed at a later period.

Before we proceed to enquire how far the evidence of history agrees with the evidence of construction, it will be better to introduce the description of another religious building in the immediate neighbourhood of Mortain, which throws additional light on the subject in question.

After our minute and attentive examination of the collegiate church, we descended into the valley, crossed the river, ascended the opposite height, and after a walk of some length, came to the Abbaye Blanche, a ci-devant nunnery in a most secluded and romantic situation. This abbey is known to have been founded in 1105, by the son of that Count Robert who built the collegiate church. The one building might, therefore, be naturally expected to illustrate the other; and it *does so*—but how? Is the church of the Abbaye Blanche in the same confirmed style as the collegiate? On the contrary, instead

of being *pointed* throughout, parts of it are in the round style, parts in the transition, and it is only in such parts as may have been alterations, that the confirmed pointed appears. The windows at the west end are round-headed, the windows in the choir obtusely pointed. In the transepts are round-headed windows above, and pointed below. There is a circular window both at the east end and at the west. The arches under the tower are pointed, and rest on cluster columns. Pointed arches support the roof. All the pillars have Norman capitals.

The Abbaye Blanche, therefore, is of an infinitely earlier character than the supposed anterior church in its immediate vicinity.

Part of the old cloister remains. Its slender pillars, and small round arches, are in a style which in England would place it in the latter part of the reign of Henry II.

An additional argument against the antiquity of the collegiate church, is to be found in the ruins of the Abbey of Savigny, which is situated in the

neighbourhood of Mortain, and arose from the munificence of its lords. The church of the Abbey of Savigny, of which the existing ruins are remains, was only begun in 1172, was not completed till many years after, and yet, as will be seen, the greater part of this building was in the round style.

So far as the Abbaye Blanche is concerned, history sufficiently accounts for the little accordance of its style with the date of its foundation. The founder of the abbey was taken prisoner at Tinchebray, the very next year after the foundation, and was sent into England, where he died some years afterwards. The buildings at the abbey were not likely to be proceeded with during the captivity of the founder. Other Counts of Mortain must have resumed the pious work in more tranquil and prosperous times.

But, having shown that the church asserted to be the identical building constructed in 1082, is in a much *later* style than the church which was not begun till long after that year, what shall we

believe to be the real date of the two existing fabrics?

Let us search for the times in which it is not unlikely that the church of Mortain may have been destroyed; for the more peaceable days in which it is probable that religious buildings would have been carried on; and for men who were affluent enough to undertake works of magnitude.

The times of devastation are abundant. After the battle of Tinchebray, when Henry I. of England vented his wrath on Mortain, and demolished the greater part of the castle; during the wars between the Counts of Anjou and Blois, and between Henry II. and the Norman barons; during the invasion of Normandy [a] by Philip Augustus, and the simultaneous inroad of the infuriated men

---

[a] Anno 1213.—" Nobile nec castrum Moretonia
Funditus a fundo excisum et cum plebe sepultum;
Quique laborabant ipsam defendere, ad instar,
Omnes a Francis capti, occisique fuerunt."
Gulielmi Britonis Armorici Philippidos.

of Brittany, who rushed into Normandy [a], to revenge the murther of their young Duke Arthur, who are known to have visited Mortain, and who ravaged wherever they went. In those feudal wars, it was a common thing for the churches to suffer together with the towns.

The times, after the battle of Tinchebray, when Mortain was at rest, were under the government of Stephen of Blois, and of William, his son, during the greater part of the reign of Henry II., part of the reign of King John, and under Philip Augustus, of France, after the wars were over, by which he became possessor of Mortain,

---

[a] "After the death of Arthur, Guido de Thoarciâ, who was regent of Brittany, went with a large army into Normandy, and began by attacking Mont St. Michael, which he took, and set fire to the convent and church. This accomplished, he attacked and took Avranches, set fire to many villages, and went on, destroying every thing on his way, to join Philip Augustus at Caen. Philip Augustus, wishing to relieve Normandy from the presence of such a scourge, sent Guido and his Bretons back, by Mortain and Pontorson."—Gulielmus Armoricus.

and of Normandy. At a later period, Mortain fell into neglect, only giving a title to princes of France, who never made it their residence.

Combining with these historical data the evidence of construction and style, I should incline to the opinion, that the collegiate church of Mortain suffered during the struggle between John and Philip Augustus, either from the soldiers of the king, or the men of Brittany; and that it was rebuilt, with the assistance of Philip Augustus, after peace was restored.

Philip Augustus is known to have sought to ingratiate himself with his new subjects by munificent donations in aid of the Norman churches, many of which suffered during those wars; and he connected himself more intimately with Mortain by giving that district to his son, the Count of Clermont, and by garrisoning the castle of Mortain with royal troops.

With regard to the church of the abbey, we are equally left to conjecture. The names, and only the names, of three of its early abbesses have come

down to our times. The first of these was St. Adelina, who died in 1125; the second, Bergonia, who died in 1170, and the third, Minguidia, who died in 1182.

It is hardly probable that a succession of three abbesses would be permitted to pass away without seeing the commencement, at least, of their church, and Stephen, before he became king of England, is known to have extended his protection to this abbey. The probability, therefore, is, that those portions of the church which are in the round style, arose in the time of Stephen, that the work proceeded slowly, that some interruption took place, that the transition part was added in the latter part of the reign of Henry II., and that it was completed in the first years of the reign of John. The church underwent extensive repairs so late as 1604[a]. Whatever was done then must have sought to be in keeping with the old

---

[a] "1604.—Isabella de Saussay, Abbatissa, ecclesiam reparavit, et ornavit."—Gallia Christiana.

character of the building, for all that exists is in the ancient style. But the fact of these reparations would sufficiently account for any apparent anomalies.

CHAPTER XVI.

SAVIGNY.

About eight miles from Mortain are the ruins of the Abbey of Savigny, formerly one of the most celebrated religious foundations in Normandy.

This abbey was protected and favoured by successive kings of England; by Henry I., Stephen, and Henry II.

The church remained intact till the revolution, when it was almost entirely pulled down.

I was accidentally prevented from visiting Savigny myself, but Mr. Hussey went there, and I subjoin an account of what he saw, in his own words.

The remaining portions of the abbey church of Savigny are the wall of the west front, which is

not much injured; the greater part of the wall of the south aisle of the nave, with a portion of that of the north, the latter, a good deal injured, the former, tolerably perfect; half the end of the north transept, and the whole of that of the south, but both more or less injured. These, with some portions of rubble masonry to the east, form all that is now standing of the church, and the whole area of the interior is covered, to the depth of many feet, with stones and rubbish.

From the little which now exists of this church, it is hardly possible to ascertain what was the style of its architecture, yet the few details which remain are of a character decidedly transition; seeming, however, to partake more of the round than the pointed style.

The pilasters against the walls of the aisle, have late Norman capitals, and the springing stones of the ribs of the vault show mouldings of a mixed character.

The vault of the nave, from the rib which re-

mains attached to the inside of the west wall, was, I think, just pointed; but this rib shows the commencement of what must have been so nearly a circle, that a tender conscience would hardly venture to swear to its having been either the one or the other.

The west window is large and singular, and, I think, must have been an insertion, though, from the nature of the masonry (rubble work) there is nothing to show that this was the case. The window is obtusely pointed, divided into three pointed compartments, with a trefoil at the top. The west door is, also, very singular, the upper part of it being in the shape of the favourite trefoil.

The transepts had each a circular window at the end, which, I think, never contained any tracery, except a single row of bold, semi-circular, featherings round their edges, and these are nearly destroyed.

Adjoining to the church is a considerable extent of vaulting, which has served as substructions.

It is all turned in rubble masonry, with round arches, supported on columns, having late Norman caps.

Over a portion of these vaults there yet stands a large oblong room of good proportions which seems to have been the refectory. The old windows are destroyed, so that nothing now remains except the vault, which is pointed, having, however, ribs with Norman mouldings, which spring from pilasters having Norman caps. The entrance doorway to this room is so much concealed by rubbish, as only to leave the upper part visible. It was, however, round headed, and was encircled by a single Vandyke moulding. It was divided by a pier, into two, and the tops of these subdivisions were also round.

The whole of the masonry is exceedingly simple, plain, and good.

The date of this church is known. It was begun in 1173 by Abbot Josse, to replace an older church which had only been finished in 1124, but which had been built on so small a scale as to be

considered discreditable to an abbey that had become very rich. Henry I., Stephen, and Henry II., equally favoured this abbey, and increased its possessions with fresh endowments. The new church was not consecrated till 1220, in the presence of the Archbishop of Rouen, and many Norman bishops.

The church was attacked and much injured by the Calvinists in 1562. They slew the Abbot, destroyed the organ, burnt the wood work in the church, carried off the sacramental plate, and plundered the treasury. The church was restored by Claude du Bellay, who was Abbot from 1588 to 1609.

CHAPTER XVII.

AVRANCHES.—ABBEY OF LUZERNE.

May 28.—From Mortain we went to Avranches.

The road keeps along a ridge the greater part of the way, and commands a rich and beautiful country on either side; affording, as you advance, occasional glimpses of the sea, and Mont St. Michel.

Avranches stands in a delightful situation, on an height.

Of the old castle, extensive walls, and several dismantled towers remain. These ruins are encircled by public walks, which command beautiful views. The finest view is from the Calvaire, which marks the spot where the cathedral stood till the revolution, when the blind populace destroyed the great ornament of their town. No cathedral had

ever a more advantageous position. It stood on the extreme point of the platform of the castle, apart from all other buildings, and, elevated as it was, with its two noble spires, must have been a grand object.

From this spot you behold a wide extent of rich, and well wooded country, a winding river, the sea, with the pyramidal form of Mont St. Michel, and its satellite, the rock of Tomblaine.

Avranches must be an agreeable place of residence. It contains many good houses. Every thing is cheap. The climate is mild—the air, salubrious—the surrounding country diversified and pleasing. Of the society I had no opportunity of judging, but in most of the French provincial towns there is still society to be found, who meet at rational hours, and on easy terms.

At Avranches we engaged a cabriolet to take us to the Abbey of Luzernè. To get there, we had four leagues of good road, and one of *traverse*, which, as usual, we had to perform on foot.

The abbey stands in an agreeable and seques-

tered situation in the vale of the Thar, surrounded by hills and woods.

All the buildings are complete. At the Revolution they were bought by an individual, and turned into a cotton manufactory, which has failed.

The church remains entire.

This church is in the early transition style. The arches, on each side the nave, are obtuse; those under the tower, more sharply pointed. The arches of the nave rest on square piers, which have small recessed pillars at each angle.

The roof is vaulted, and of stone. The transverse ribs are round and plain; the diagonal ribs are moulded.

The windows are round headed. The great western portal is round headed, with Norman mouldings, and has, at the sides, pillars with Norman capitals.

Above this round headed door, is a pointed window, above which are three pointed recesses,

the mouldings of which exhibit the tooth pattern.

The east end is square, with a large pointed window; but the probability is, that the whole of this part of the building was a re-construction.

In the tower, the windows are long, narrow, lancets. The summit of the tower is of a later date than the base.

Of this church the foundation stone was laid in 1164, and a consecration took place in 1178[a] —but, at that time, only the chancel, the choir, and the transepts, were in existence. No record remains to show how soon the remainder of the building was completed, but, as this abbey appears to have enjoyed the uninterrupted favour of successive Bishops of Avranches, and as, in 1207, it gave back to the cathedral of Avranches (that cathedral then requiring extensive repairs) a source of profit which a former Bishop of Avranches had conferred upon Luzerne[b], to facilitate

[a] Neustria Pia. [b] Ibid.

the construction of its church, we may conclude that the building went on without much interruption, and that before 1207, it was complete.

A religious house had been founded at Luzerne in 1143, but it only acquired importance in 1162 from the donations and endowments of the family of St. Jean, who were its second founders, and who removed the abbey and the church to a new situation.

The St. Jeans lived at St. Jean-le-Thomas, near Avranches.—A branch of this family settled in England, where the name was translated into St. John, and in time augmented by the title of Bolingbroke.

The abbey of Luzerne suffered in the wars of the fourteenth century. At the close of that century it was repaired by Abbot Jean du Rocher; —amongst other things, he rebuilt the upper part of the tower, which accounts for the difference of its style.

After having passed some time in the examination of this building, we returned on foot to the pothouse, where our cabriolet was awaiting us. On

our way we fell into conversation with an old peasant whom we met on the road, and who looked as if he wanted assistance, though he did not ask it. His words soon confirmed the indication of his looks, for he told us he was now unfit for work, and had no provision for his old age. "Then it seems," I observed, "the Revolution has done nothing for *you*." "No, Sir," he replied, "neither the last, nor the former, Revolution. Each time they told us it would be a fine thing for the poor; *mais les pauvres sont toujours restés pauvres*." All we could do was to cheer him for the moment with a little relief.

We returned to sleep at Avranches.

CHAPTER XVIII.

MONT ST. MICHEL.

May 29.—Taking horses, and a guide at Avranches, we set forth on an expedition to Mont St. Michel. At low water you can ride the whole way to the insulated rock. Having reached the sands, which are hard and safe, we got on at a good pace, but had twice to wade through broad channels, which are never dry. At the second wade the water was deep, the current strong, and the wind set against it. Our horses began to be puzzled, and our feet were in the water; but the critical moment was soon over, and, after this inconvenient passage, we had good sands all the way to the Mount.

Mont St. Michel is picturesque in every point of view. At its base are fortified walls, behind which appears the little town; above the town are seen rocks, and the vast substructions which support the convent and the church. The conventual buildings, gateways and walls, form a base to the church, which rises above every thing else, and crowns the apex.

This granite mount afforded a suitable and tempting situation for a church in honour of the saint whose name it bears, and whose temples were habitually built in high places. The Norman achievement stimulated the emulation of England, and St. Michael's Mount in Cornwall soon became the counterpart of Mont St. Michel.

You ascend by divers flights of steps, and pass through more than one gateway, before you reach any part of the convent. The last gateway is very scenic and baronial. This is, probably, the gateway which Abbot Thurstin built in 1257.

The convent and church, being now converted

into an house of correction, are so subdivided, and blocked up with partition walls, that every thing is seen to disadvantage. The arches on each side the nave of the church are walled up, but you can distinguish the pillars, and perceive that they were built in courses, and had capitals. This part of the church belongs to the eleventh century.

The choir is preserved as the chapel of the present prison. It was begun in 1452, carried on at intervals by successive abbots, and only finished in 1521. It is a beautiful specimen of the pointed style, though less enriched than other cotemporary works, which is accounted for by the hardness of the granite of which it is composed.

But the most remarkable remnant of the convent, is what is called the Hall of the Knights. It is a splendid oblong room, of which the stone, vaulted, ceiling is supported by a forest of pillars. As the knights of St. Michel were only instituted by Louis XI., in 1469, this room can scarcely have been built for them; its style resembles that of the time of our Henry III. It may have

been a state refectory, prepared for the reception of the noble and royal devotees who flocked to this place in ancient times. No record, however, remains, by which the real date of this room can be ascertained.

The first church built on this spot, was built by St. Aubert, in 709. The second was built by Richard, Duke of Normandy, and finished in 996. This church was destroyed by fire in 1001. Richard II., son and successor of Richard I., began a new and more magnificent edifice in 1022. The nave of this building, which still exists, was only finished in 1060.

The buildings of this convent have undergone more disasters, and consequently more alterations, than almost any other. They were ten times injured by fire; sometimes by lightning, sometimes through the violence of man, when the convent was used as a fortress, and attacked by the hostile party. Repaired as often as they were injured, the convent and church still remain a splendid and picturesque pile of architecture.

On returning to the little inn, after our visit to the convent, we heard the old landlady express an opinion which revealed the secret source from which so many opinions arise. She said that, in the time of the monks, all strangers were lodged and fed in the convent, whereas, now, they were all obliged to come to her inn, and, *consequently*, the monks were much better away.

Our guide had been so much frightened by the depth of the second wade, that on our way back, he insisted upon our taking another route, which avoided the danger, but was very circuitous. In consequence, it was much later than we had intended when we got back to Avranches.

CHAPTER XIX.

PONTORSON.—SAUMUR.—CHINON.—FONTEVRAUD.—ALENÇON.

May 30.—From Avranches we went to Pontorson, the last town in Normandy. At Pontorson is another ancient church, of which a part is old Norman, but the western front is early transition, and evidently of later construction.

In this west front, both round and pointed forms appear. A recess, of which the arch is pointed, encloses a round headed portal and the window above it. Above the pointed arch is a window with two divisions, of which the tops are round; the front, terminates in a sort of pediment, at either angle of which is a pierced turret. The whole is constructed of granite, of

which there is abundance in this part of Normandy.

A church was built on this spot by Robert, father of William the Conqueror, and the body of the existing church appears to belong to his time. The joints of its walls are wide, and the mortar is coarse. The west front must have been altogether rebuilt at a subsequent period. The Castle of Pontorson was burnt in 1171 [a], during the wars in which Henry II. was, at that time, engaged. The church may have suffered on the same occasion. The style of the west front of Pontorson is of so much the same character with that of Luzerne, that, whatever may have occasioned the work, it must have been executed at nearly the same period.

Leaving Pontorson, we traversed Brittany, in order to visit the celebrated Druidical temple

---

[a] "1171.—Castrum Pontis Ursonis combustum est. Henricus Rex venit ad Pontem Ursonem."—Ex Roberti de Monte Appendice ad Sigebertum.

at Carnac[a], after which exploit, we proceeded to Nantes, and from thence, by ancient Angers, and along the delightful banks of the Loire, to the pretty little town of Saumur, which is entirely built of light coloured stone, and contains many good houses.

Our object, in making this expedition, was to visit Chinon, the French Windsor of our Norman kings, and Fontevraud, the place of their burial.

Chinon is about five leagues from Saumur, and about four from Tours. The road conducted us along the banks of the river, which are, in places, very picturesque. Copses and vineyards abound, interrupted and varied by chalky cliffs. Many

---

[a] The immense extent of the remains of this temple, its high degree of preservation, and its situation, on a bleak heath near the sea-shore, make it well worthy of a pilgrimage; but, after all, it must be owned that the few more colossal fragments of Stonehenge appeal to the imagination in a still more powerful manner.

habitations, some chateaus on a small scale, are scattered along the side of the road, on little eminences of their own. Large walnut trees often intervene between the road and the river. These ingredients, together with the gay population, and bright sun, of this delicious part of France, supplied us with a succession of agreeable pictures.

The Castle of Chinon, most advantageously situated on a commanding height, has the best appearance at a distance, and when approached from Saumur. There still remains a stately length of walls, diversified with numerous towers, domineering proudly over the town.

Nothing, however, or only one round tower at an angle, remains of the Norman castle; nothing more ancient than the 14th, or perhaps even the 15th century, is now in existence. The most picturesque feature is the lofty tower at the entrance.

The general plan of the castle consists of two large courts, approached by bridges. There is a third mass of ruin, which stands beyond and aloof,

and probably was the oldest part; but this mass consists of little more than substructions. At one angle of the first court remain the walls of some of the living rooms, with their huge chimney-pieces still in their places.

The view from the castle is magnificent. The eye wanders up and down the wide vale of the Loire, which sweeps immediately round the base of the height. The Loire is here of an ampler breadth than the Thames at Windsor, and the country through which it glides is more diversified than that which the noblest palace in Europe surveys. I could quite understand why Henry II. was so fond of Chinon.

On our way back to Saumur we turned off the road to visit Fontevraud. We went from the palace to the tomb.

The Abbey of Fontevraud, from its vicinity to Chinon, naturally became the place of royal sepulture. It stands in a sequestered dell, about a league from the Loire, and three leagues from Chinon.

The church, of which the outside remains intact, is considered to be the one begun by Foulques, fifth Count of Anjou, in 1125. It has transepts and five apsides at the east end. The more ancient parts of the building are in the round style. There are pointed arches under the tower, and the windows in the tower are pointed also; but this must have been a reconstruction. There is nothing pointed any where else. The capitals, mouldings, and ornaments, in every part of the building, are rich, elaborate, and sharp as if they had been finished yesterday. The whole is built of the chalk-stone of the neighbourhood.

Such is the exterior of the church, but its interior is unfortunately changed. It is converted into a maison de force, and all within, however beneficial, is repulsive. The royal tombs, in quest of which we came, are no longer in their original situation. They are placed, on tressels, in a dark corner, and disregarded, if preserved. We found the monumental effigies of Henry II.

and his queen, of the queen of King John, and of Richard Cœur de Lion. All these personages are in their robes, of which the drapery is rather stiff. The faces have been injured, more or less, by the Vandals of the Revolution, but the face of Richard has suffered the least. The forehead is remarkably wide, and there is a stern expression of force and resolution in the countenance that might well have dismayed the Paynims. It was impossible not to wish that Richard, at least, might be removed to the now more appropriate resting-place of Westminster Abbey.

It was striking to behold these traces of our kings in so distant a land, and no less striking to reflect how much more powerful England is now than when the kingdom was so much more extensive.

From Fontevraud we returned to Saumur, retraced our steps to Angers, and proceeding from thence by Le Mans, where there is a fine cathedral, and Alençon, where there is nothing, re-entered Normandy.

CHAPTER XX.

SÉEZ.—BROGLIE.—BERNAY.

June 6.—The first place which offered any thing to detain us was Séez, a poor little town, but the seat of a bishop, and, consequently, possessed of a cathedral.

The cathedral of Séez is another of the buildings in the pointed style to which an incredible date has been assigned. The last date on record has been accepted as the necessary date of the whole existing fabric, and the possibility of unregistered reconstructions has been overlooked.

There certainly was a new cathedral begun at Séez in the year which is assigned as the date of

the existing cathedral, 1053. The events which led to this reconstruction are so illustrative of the state of society in the middle ages, that I subjoin a short account of them, though they have nothing to do with the present fabric.

During the episcopate of Ivo, bishop of Séez, the Soringi, three sons of a feudal lord of the neighbourhood, collected together a band of associates as lawless as themselves, and ravaged, and pillaged all that district. For some time they were scarcely resisted; and, finally, they had the audacity to take possession of the cathedral of Séez, make it their fortress and dwelling place, from whence they sallied forth to collect plunder, and returned to pollute the temple with licentious orgies. At length the bishop persuaded Grantmesnil, and other barons of the province, to come and attack the intruders. The Soringi shut themselves up in the cathedral, and, in order to smoke them out, the bishop ordered some of the wooden houses near the cathedral to be set on fire. The object was answered: the Soringi and their asso-

ciates came forth and were defeated; but the fire spread, enveloped the cathedral, and caused its total ruin. It happened that the Pope was at that time in France. Some of Ivo's enemies induced Leo to believe that the bishop had wantonly set his own church on fire; and, although Ivo in part relieved himself from the charge, by relating how the conflagration had arisen, yet the Pope ordered him to rebuild his church, and find the means in the best manner he could. In consequence the bishop undertook a journey to Apulia, Constantinople, and other places, to implore the assistance of the wealthy and the great, and had the good fortune to return to his diocese loaded with alms and oblations. He immediately began a new church, on so large a scale that it was only completed in forty years [a].

Such is the history of the reconstruction in 1053; and nothing but indirect evidence, or faint

---

[a] William of Jumieges, lib. vii., cap. 13.

indications, remain to throw any light on the subsequent fortunes of the fabric.

The fabric itself, however, demonstrates that it is *not* the cathedral of the eleventh century. It is pointed throughout; but exhibits a variety of style, which proves that different parts must have been built at different times. The west end and the nave are the oldest: of these the style is early pointed. On each side of the nave are pillars, built in courses, with bases and capitals. These pillars support pointed arches with mouldings. The windows are double lancet. The style which prevails throughout the whole of this part of the church, resembles that of our Henry III.

The transepts and choir belong to quite another period. These are in the decorated style of pointed architecture.

Neither histories, nor chronicles, expressly acquaint us with the events which led to the second reconstruction, certified by the change of style, or with the period at which the different

parts were built. We know, however, that, in 1150[a], Louis, king of France, enraged at the treacherous conduct of John, the son of William Taluas, then lord of Séez, came to Séez with a large force, took the town, and burnt it to the ground[b]. Séez was again destroyed by fire, in 1353, by the English.

It is highly probable, therefore, that the eleventh century cathedral suffered, together with the town, in the conflagration of 1150, and arose again, like other cathedrals, in more peaceable times. The cathedral appears to have suffered again from the conflagration in 1353[c], as, in 1408, we find Peter,

---

[a] "Anno 1150, Gaufridus Comes Andegavorum cœpit Castellum de Nube super Robertum Comitem Porticensem, quòd anno præterrito perdideret per traditionem Johannis filii Gulielmi Taluas—unde Rex Ludovicus, iratus, et Robertus, filius ejus, congregato ingenti exercitu venerunt usque Sagium, civitatem Gulielmi Taluas, et eam combuxerunt."—Ex Chronicis Anonymi.

[b] "1353.—Anglicano igne, urbs (Sagium) consumpta est, et funditus eversa."—Gallia Christiana.

[c] "Petrus I., Sagiensis Episcopus, 1408, Testamentum condidit 16 Maii, anni ejusdem. In eo expressum habetur,

bishop of Séez, making provision in his will for its reparation.

The dates of these historical hints sufficiently correspond with the style of the fabric, and sufficiently account for the difference in its parts. Such, however, are the feeble aids, through the help of which the antiquary has to grope his way; but if the poverty of his resources may serve as an excuse for his sometimes being in the wrong, it should teach him to insist with the less confidence on the certainty of his being in the right.

Resuming our progress, a short time before we came to Broglie, we caught a view of the country residence of its duke. It is a large old chateau on a bank, with a good deal of wood in sight. The present duke, who is one of the most distinguished and excellent men of France, passes much of his time at this chateau, and, formed, as he is, to make

---

pro reparatione ecclesiæ suæ, acto cum exsecutoribus defuncti Gregorii antistitis confecto, tam pro mitrâ, pedo, et annulo pastorali, quam aliis rebus, conscribi fecisse unum Pontificale, duobus voluminibus."—Gallia Christiana.

a figure in the conduct of great affairs, can still enjoy the simple pleasures of the country.

Broglie is a very neat, little, half-timber, Norman town. Part of the church is rude, ancient, and built of a singular breschia. Within the church, flat piers support plain, round arches; but a side aisle has been added, and the primitive part adjoining to the more modern aisle has been adapted to its neighbour by the insertion of pointed arches under the old semicircles. A Lady's chapel, in the pointed style, has been substituted in the place of the original apsis. In the west front, interlacing arches are introduced as an ornament. The only date, relating to this church, which I have been able to discover, is that of a consecration, by a bishop of Evreux, in 1224[a], which seems to indicate the time when the parts in the pointed style were added.

After leaving Broglie, we traversed a richly wooded valley, and soon arrived at Bernay, which

---

[a] "Ricardus, Elroicensis Episcopus, Ecclesiam Beatæ Mariæ de Brolio, consecravit 1224."—Gallia Christiana.

once derived celebrity from its rich Benedictine abbey. This abbey was founded, in the first years of the eleventh century, by Judith of Brittany, wife of Richard the Second, Duke of Normandy [a].

Much of the original work remains, and is perhaps the most ancient building of any consequence now existing in Normandy. On this account it is a curious and interesting monument, and it bears ample testimony to the grand and simple ideas of the early Normans. Large in its dimensions, and lofty, it is entirely without ornament. The plain round arches, on either side of the nave, rest on plain, rectangular piers, with pillars attached. The joints of the pillars do not exactly correspond with the joints of the piers. The pillars, however, are early Norman, and have varied, foliage, capitals, without any mixture of the grotesque figures which were afterwards introduced. On one of the capitals, is the

---

[a] Neustria Pia.

inscription, Me fecit Izembardus—a proof that the workmanship was considered a great achievement. In the upper part of the transepts is a triforium, with round-headed openings, divided by a small pillar.

The church had two aisles on each side the nave; transepts; a principal apsis at the end of the choir, and an apsis in either transept.

The *dome* vaulting [a], over the aisles, is exceedingly curious, and has every appearance of being original.

The abbey was secularized at the revolution, and the church now belongs to two tradesmen, who have divided it into warehouses.

Bernay is situated in an agreeable valley watered by a little river.

---

[a] Dome vaulting is constructed in circular courses.

CHAPTER XXI.

EVREUX.—ST. TAURIN.—SHRINE OF ST. TAURIN.—SHRINE OF ST. CALMINIUS.

June 7.—We passed through a cheerful and varied country, green with pastures, chequered with orchards, and enlivened with villages and farms. The Norman farm-house, which is always half timber, always in the midst of an orchard, and always sheltered by trees, is a pleasing feature in the landscape. Normandy constantly put us in mind of England, and of Herefordshire especially.

In a short time we looked down upon the pretty town of Evreux, at the bottom of its basin. Evreux is an old half timber town, situated in a fertile valley, which is watered by two little rivers. It possesses handsome churches, of which

the Cathedral and St. Taurin are the most conspicuous.

Evreux was early celebrated for a chapel, built by St. Landulfus in memory of St. Taurinus, who first preached the gospel in Neustria.

The Cathedral, with the exception of the west end, which is modern, is, for the most part, in the advanced pointed style. The rose, and five light windows, at the end of the south transept, are in good taste. The windows, and ornaments, at the end of the north transept must be at least a century later. The choir is very lofty and beautiful, with its light, cluster, piers. On each side the nave are the pillars and round arches of an earlier church.

The discordance in the different parts of this building is accounted for by the injury it received in 1194, when Philip Augustus[a], waging war with

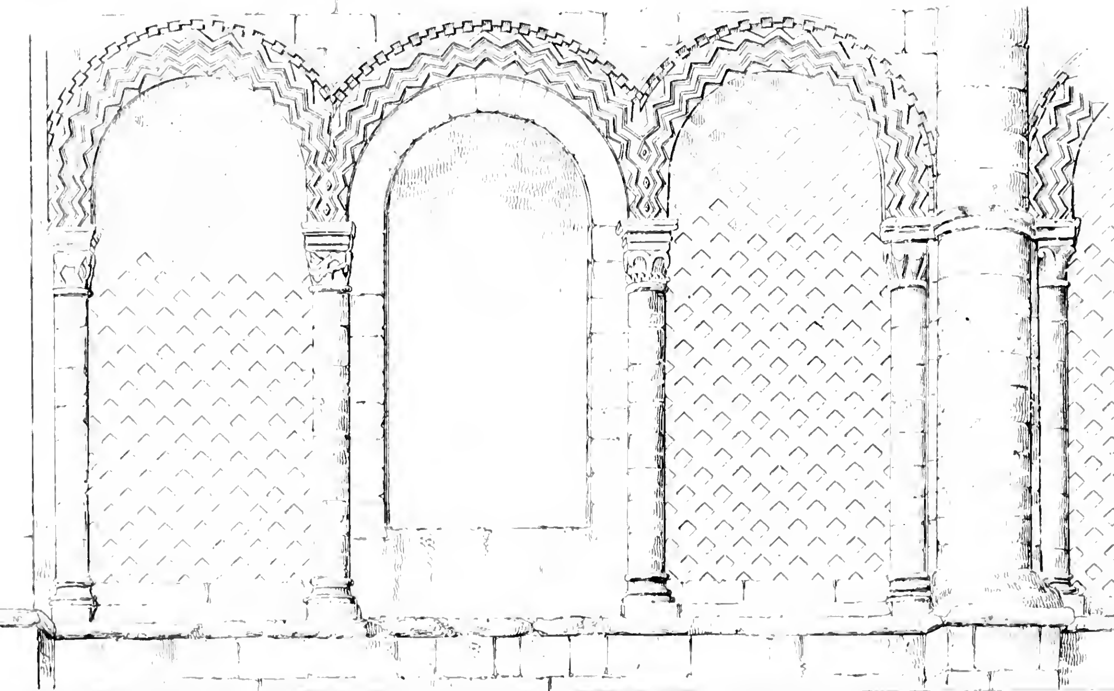
---

[a] "Ebroicas primo sic incineravit, ut omnes
Cum domibus simul ecclesias consumpserit ignis."
Gul. Brit. Armor. Philippidos.

King John, fell upon Evreux, set it on fire, and is recorded even to have destroyed the churches. Such accounts, however, must be taken with a certain degree of reservation, as they often represent partial injury to be total destruction. So was it the case at Evreux, where the nave of the cathedral, which was consecrated in 1076, still exists. No record remains of the reconstruction of such parts of the cathedral as were damaged. But we see, by the Gallia Christiana, that Radulfus the Second was the first bishop, after the conflagration, who was buried in the cathedral. His predecessors were buried elsewhere. From hence it may be inferred that the restoration was only completed in his time. He died in 1256, having added two chapels to the church about ten years before [a].

Adjoining to the cathedral is the Bishop's palace, part of which is a good specimen of the

[a] "Radulfus II. Ebroencis Episcopus, duos, in Ecclesiâ cathedrali, fundavit capellas circa 1245, sepultusque est in navi ecclesiæ majoris, 1256."—Gallia Christiana.



C. Burton del.

ARCHES ON THE END OF THE SOUTH TRANSEPT St TAURIN, EVREUX.

style of the fifteenth century. Domestic architecture always seems to have followed the fashion which was always first set by ecclesiastical buildings.

The history of the church of Taurinus is the counterpart of that of the Cathedral. In place of the humble chapel of Landulfus, a magnificent church and abbey were erected on the same spot, in 1026, by Richard II., duke of Normandy. The church of Richard was half destroyed by Philip Augustus, and was restored, long after, in the pointed style.

On the outside of the north transept, which is a fragment of the original church, remains to be seen, a curious specimen of the terra cotta ornament, which was introduced by the Romans, and copied by their successors. It consists of various patterns formed with thin tiles of different shapes and sizes.

In this church is still preserved one of those splendid shrines which are become so rare. It was made to receive the ashes of the saint, accord-

ing to the inscription which it bears, at the expense of abbot Gilbert, in the year 1250.

The material is principally silver-gilt; copper-gilt at the corners, and less conspicuous parts. The shape is that of a chapel, of course in the pointed style. The architectural parts are very elaborate, and display a richness of ornament which is appropriate in works of little size. In compartments, on the four sides, are bas reliefs representing different events in the life of the saint. The shrine was once studded with precious stones, most of which it has lost in the various casualties to which it has been exposed.

These shrines were common in the flourishing days of the church, and afford a proof of proficiency in the art of working in gold, silver, and enamel, during a period when the fine arts, in general, were in abeyance. The small number of these shrines, which are still to be found in the treasuries of Catholic churches, are curious as works of art, and interesting as illustrative of the architecture of the day—having always archi-

tectural ornaments about them, even when they are not in the shape of buildings. The architectural ornaments of the oldest shrines are in the round, or Romanesque, style, but became pointed when the pointed style was adopted.

I saw another of these shrines in the sacristy of the church of Mozac, near Riom en Auvergne. This shrine is in the shape of a sarcophagus, and in the Romanesque style. It is made of silver-gilt, and ornamented with pictures in enamel. It contained the ashes of St. Calminius, and Numadia, his wife, whose pious actions are portrayed in the pictures. This shrine was made about the middle of the tenth century, as appears from an inscription which it bears—"Petrus Abbas hanc capsam fecit pretio."—The first Peter who was abbot of Mozac held that office at the time above mentioned.

CHAPTER XXII.

ROUEN.—CAUDEBEC.—LILLEBONNE.—MONTIVILLIERS.—GREVILLE.—HAVRE.

Leaving Evreux we advanced, through the same sort of country, to Louviers; soon after which we began to catch, from the high ground on which we were travelling, delightful views of the Seine, and, in a short time, found ourselves once again at Rouen. At Rouen I parted with Mr. Hussey, who was to remain some time longer in Normandy to finish various drawings. Not setting out till late, I got no farther than Caudebec that afternoon. The drive from Rouen to Caudebec is always charming, and the situation of the neat little inn at which I alighted, made me wish that another day had been at my disposal. The little quay in front, the noble breadth of the river, and the large trees of the adjacent public walk, strongly persuade delay.

The next day, however, I resumed my journey, and diverged from the direct road to Le Havre, to visit Lillebonne. To penetrate into the interior of this part of Normandy, you have to scale the hills, which here skirt the Seine. During the long, steep ascent, the road is necessarily conducted in traverses, and from your winding course, through defiles clothed with wood, you catch lovely glimpses of the Seine, Caudebec, and the country on the further bank of the river. After having once attained the high ground, you remain on that level till in sight of Lillebonne, when you descend rapidly, and finally rise up into the town.

The situation of Lillebonne (the Julio bona of the Romans) is noble; on an eminence surrounded by hills, in the southern range of which a fortunate gap allows a view of the Seine, there enlarged into the semblance of an arm of the sea.

The remains of the castle crown the height. The circle of walls round the court exists, together with a fourteenth century tower, the fragment of

another, and a large mass of old Norman building. A modern house, but not an offensive object, has grown up amongst the ruins, on the northern side.

The old Norman remnant appears to have been the great hall of the castle. Its walls are constructed of rubble, with a coating of rather small courses of squared stone. The windows are large, but all turned to the court. Each window is divided nearly into half by a transom, supported by a small pillar, and each window has a recessed pillar on either side. You see by the chimney-pieces, and other indications, that the great hall itself was not on the ground, but on the first floor, with a low, vaulted, room beneath. Safety must have been the original object of such an arrangement.

The castle, with the ground it stands on, has lately been sold to a tradesman of Bolbec. I rather envied the purchaser, so delightful a spot would it be to work upon. The court, enclosed with its venerable walls, might easily become the cheerful foreground of a flower garden, with the

old Norman building for its boundary, and peeps at the magnificent view beyond, might easily be obtained. But the tradesman of Bolbec will probably work upon it in a different manner.

Just below the castle, has been discovered, and carefully cleared out, the fragment of a Roman theatre. Little more than substructions remains, with small portions of the external walls, which were constructed in the same manner as the Norman building, with rubble, faced with small, squared stones.

Near this theatre was found, a few years ago, a Roman statue of bronze gilt, which I remember to have seen exhibited in London. It was curiously unequal in merit. The limbs are good; the head is coarse, as if an head of inferior workmanship had been substituted for its own in later, and less skilful, times.

Soon after leaving Lillebonne I joined the great road to Havre. The views are fine, as you return to the banks of the Seine, and descend upon Harfleur and its spire.

At Harfleur I diverged again, and drove up a wide valley to the neat little town of Montivilliers, once celebrated for its Benedictine abbey.

The church remains entire, with its large, central tower, and an octagonal tower, terminating in a spire at the west end.

All the church is in the round style, except the northern aisle. The capitals of the pillars in the nave are mere cubes—those in the choir have foliage. The transepts are more enriched. Mouldings are carried along their walls, and a few figures appear on the capitals of their pillars; amongst these figures I discovered the mermaid [a]. Curious

---

[a] Pages upon pages have been filled with attempts to discover and explain the meaning of this figure.—Was it a symbol? Was it the representation of a northern divinity, introduced by the northern nations? Or was it a mere ornament, copied from the Syrens of classical celebrity? All that can be asserted is that the mermaid did not appear as an ornament of Christian churches till after the inroad of the northern conquerors. I observed it more than once in the Lombard churches of Italy. It often occurs in France, and the author of La Religion des Gaulois labours to prove that the mermaid

crumpled monsters are introduced as capitals of the half-columns which run up to support the roof of the choir. The west portal is enriched with several mouldings, two of which exhibit the zig-zag, and tooth pattern.

The church, as it now stands, is believed to have

---

represents the goddess Onuava, the celestial Venus of the Gauls, and of the northern nations. The celestial Venus was worshipped under this form by the ancient Syrians and Babylonians, and this is not the only link which appears to confirm the idea that the northern nations received their mythology, however circuitously, from the south—nor is the mermaid the only trace of the admission of Pagan allusions into Christian temples. The Sagittarius is another. The Sagittarius is a representative of the zodiac, and the zodiac, (itself a frequent ornament of the portals of churches,) is an attribute belonging to Mythras, of whose worship some of the ceremonies continued to be practised in France and Italy long after the introduction of Christianity. It was the policy of Rome to be indulgent to the old predilections of the recently converted, and, as all attributes equally belong to the only God, favourite emblems could be retained without offence to the new religion. But whether the mermaid was one of these, whether it was a recollection, or merely an ornament, I will not pretend to determine.

been begun, at least, by Elizabeth, the second abbess, who died in 1117 [a].

From Montivilliers I returned to Harfleur. Nearer Havre I walked up to the little church of Graville, which stands on an eminence by the road side.

A church was originally built on this spot to receive within its walls the body of St. Honorina. On the approach of the Normans, this precious relic was removed, for safety, to Conflans sur Marne, not far from Paris. The monks of Conflans, aware of the value of such a possession, would not part with the relic after the storm was over, and obtained oblations enough to build a new church in 1083, where St. Honorina ever after remained. But the spot which originally possessed the treasure appears to have retained its powers of attraction; the consequence of which was that a second church arose in honour of St. Honorina at Graville [b].

---

[a] "Elizabetha—creditur Basilicam Monasterii sui, quæ superest, a fundamentis excitasse. Ob. 1117."—Gallia Christiana.

[b] Neustria Pia.

This church exhibits a prodigality of ornament. On the capitals of the pillars of one side of the nave appear a variety of rude figures. But the most remarkable part of this building is the external decoration of the ends of the transepts. At each end are seen the round, interlacing arches, of which the intersections produce the form of a pointed arch. Above these arches runs a string course of animals, resting on monster corbels; the stones of the gables are worked in patterns to the summit.

Even this church, of comparatively small dimensions, has its central tower.

Nothing certain is known about the date of this edifice, but it is probable that it was begun at no great length of time after the completion of its rival at Conflans. The jealousy of the monks, who were the guardians of the defrauded spot, must have made them use every exertion to stimulate the piety of the pilgrims, and obtain from them the means of successful competition.

A new monastery was erected at this place, by

William Malet, lord of Graville. He introduced regular canons in the place of secular clergy [a], and conferred upon them all the churches in his gift, as well in England as in Normandy. His act of donation bears the date of 1203, and was confirmed by Walter, Archbishop of Rouen, in the same year. But, though William Malet built the monastery [b], there is no evidence of his having done any thing at the church, and its style, very similar to that of Montivilliers, assigns it to an earlier period. Had it been built at the same time with the monastery,

---

[a] "Ubi Clerici prius Deo inserviebant, postea vero Regulares Canonici sunt instituti, ac fundati, ab illustri heroe, Gulielmo Mallet, et Monasterium extructum."—Neustria Pia.

[b] Ex M.S. Codice Prioratus de Gravillâ:—"Omnibus ad quos præsens carta pervenerit, Gulielmus Mallet de Girardivillâ salutem. Notum sit vobis quod, cum in Ecclesiâ S. Honorinæ de Girardivillâ Canonicos Regulares aggregassem, misertus paupertatis illorum, omnes Ecclesias terrarum mearum, tam in Normanniâ quam in Angliâ, quæ ad donationem meam pertinent, illis donavi, in perpetuam eleemosynam, anno 1203," &c.—De la Roque—Histoire de la Maison de Harcourt, Vol. IV. p. 12 of the Supplement.

it would have been in the pointed style, which, before 1203, was established in Normandy, and in which style the abbey church of Fécamp, and the cathedral of Rouen, were rising from their ashes in that very year, at a few leagues distance from Graville [a].

William Malet was descended from the illustrious warrior who was standard-bearer to William the Conqueror at the battle of Hastings, and who was rewarded with extensive grants of land in England. But this, the most distinguished branch of the family, soon returned to Normandy, the son of the standard-bearer having been banished from England by Henry I., in 1102, for having embraced the cause of Robert Curthose.

Leaving Graville, I soon reached Havre, and the next day went by the steam-boat, in fourteen hours, to Southampton.

CHAPTER XXIII.

NORMAN ARCHITECTURE IN NORMANDY.

Having concluded the history of my excursion, and stated the facts which I collected on my way, I must now be permitted to draw from these facts a few inferences, whether relating to Norman architecture, considered by itself, or relating to the works of the Normans in France, compared with their cotemporary works in England.

In the first place, then, the contemplation of Norman buildings teaches us to acknowledge that, if the Normans adopted the style, as undoubtedly they did, and employed the architects, of the conquered country, they are nevertheless entitled to be considered as having imparted to their buildings a character of their own. Barbarians as they

were, they not only possessed strength of body, but vigour and sobriety of mind. Perhaps the very absence of the civilization of a degenerate state of society, left them in possession of that simplicity of sentiment, without which good taste cannot exist. This simplicity taught them to despise all attempts to excite admiration by little arts and puerile devices, and led them to endeavour to reach effect by principles more allied to truth. It has often been said, that imagination belongs to the South, and reason to the North; and of this position the buildings of the Saracens, on the one hand, and of the Normans, on the other, afford a striking illustration.

In the tenth century, at the time that the Normans became the quiet possessors of Neustria, the churches which were rising in other parts of France were less remarkable for their dimensions, than for the profusion and monstrosity of the imagery with which hands, unequal to the task, laboured to adorn them.

The style universally prevalent was as near an

imitation of the Roman, as the then state of the arts could achieve. The plan of the buildings came from Rome, and the round arches, the pillars, and the mouldings, which were employed in their construction, had the same origin. But the corrupt taste of a less civilized people covered the capitals and the portals with a crowd of such appalling images as a wild fancy was likely to suggest, and a rude hand to pourtray.

The Normans, adopting the habitual plan and the established style, rejected the meretricious accessories, and resolved to trust for success to the few great principles of strength, size, and elevation. The oldest of the Norman churches are the plainest, but the oldest aspire to dimensions which could not fail to command admiration. Their character is severe but sublime.

At the same time, the Normans had the boldness to insist upon an addition to their churches, which is admitted to be the grandest feature and chief ornament of ecclesiastical buildings—I mean the central tower. Towers had, fortunately, be-

come an integral part of churches before the Normans began to build in Neustria, but the few towers which at that time existed in other parts of France, only adorned the western end, and, to this day, scarcely any thing deserving the name of a central tower is to be found in France beyond the limits of Normandy. No one will be prepared to deny, that the effect of a cathedral as a whole, and the fine play of its outline, is chiefly produced by the central tower. Take away the central tower, and, in situations where the whole fabric can be seen at once, how tame the cathedral becomes[a]!

Size, elevation, simplicity, and strength, together with the central tower, are, then, the architectural peculiarities to which the Normans, as contradistinguished from the Franks, possess undeniable

---

[a] As, unfortunately, is the case at Westminster Abbey. A central tower was intended for this building, and attempted by Islip, abbot of Westminster, who died in 1510, but the piers were found to be too weak to support the additional weight, and the attempt was abandoned.

claims; and, if the works of the Normans, compared with those of a better period of art, must be allowed to be greatly inferior in beauty and taste, yet, to be just, we must estimate men in relation to the circumstances in which they are placed. More genius may be required to arrive at a lower point of excellence at one time, than to arrive at a much more elevated point at another. The merit is great in proportion as difficulties are vanquished, and cotemporaries surpassed. We do well to select the buildings of classic times as the objects of our imitation ; but whilst we prefer and cultivate a correct standard of taste, let us not refuse to the Normans the praise which is really their due.

Norman workmanship was, at first, only remarkable for its solidity. The walls were often built of rubble, faced with small squared stones, a manner of building which was copied from the works which the Romans had left behind them in France. The pillars were, of course, composed of larger blocks. By degrees, and in buildings of importance, larger blocks were employed in the

walls; but the joints were wide, and the mortar was coarse. Such is the case at Jumiéges. In the time of William the Conqueror, greater neatness was accomplished; the stones were squared, and the courses regular; but the joints were still rather wide, and the mortar unsifted.

Another mode of construction was with long, narrow, stones, which were placed, not in horizontal courses, but alternately inclined to the right and the left. This, from the appearance it presented, was called the herring-bone fashion. It did not remain in use much after the eleventh century[a].

The Norman walls were of great thickness, and were filled up with small stones, amongst which mortar was poured in hot. This was called *grouting*, and in time the whole mass so hardened together, as to acquire the consistence and strength of a solid rock. Such walls stood in no need of

---

[a] M. de Caumont.—Architecture Religieuse du Moyen Age.

buttresses, through the means of which more advanced science afterwards obtained an equal amount of power at less labour and less expense. Buttresses, however, appear on the exterior of early Norman buildings, but seem to have been introduced only to relieve the baldness of the surface. They project so slightly that they can add but little support. In early Norman buildings the buttresses never rise above the cornice.

The plan of the early Norman churches is always that of the basilica, with a semicircular recess at the end, which recess formed the choir. The larger churches have transepts and side aisles, which are divided from the nave by arcades. The small churches have often neither side aisles nor transepts.

The arches of the nave either rest on piers, to which half-pillars are attached, or on single pillars, but hardly ever on those huge columnar piers, which are commonly seen in the Norman churches of England. Indeed, the columnar piers of England are scarcely to be met with in all

France, except in one or two crypts, where the known superincumbent weight justifies the preference of strength to beauty.

In the churches of France, single pillars preceded piers; the exact reverse of what might have been expected, were it not recollected to what an extent and degree France had become Roman, previous to the inroad of the Northern conquerors.

The pillars have always capitals, which, at first, were perfectly plain, but, from the beginning of the eleventh century, were enriched with different kinds of foliage, to a certain degree departing from, but still seeking to imitate, the Roman models.

The half pillars, which are attached to the ends of the piers, are always set back in recesses, or sinks; the same is the case with the small pillars on the outside of the windows, as also with those of the portals. Indeed, this is a characteristic contradistinction between the Norman style and the Roman—the Norman pillars are recessed; the Roman, project.

The windows are always round-headed, and undivided; and, externally, have, on each side, a small, recessed pillar, which supports an impost and moulding.

In the gable, over the entrance door of churches, a small circular window is sometimes introduced[a].

The windows of castles, and of domestic buildings, are usually divided by a single shaft.

The portals are round-headed, and were gradually enriched by an increasing number of semicircular mouldings, and a corresponding number of little pillars at the sides; but, in Normandy, I recollect no instance of the substitution of figures in the place of the shafts of pillars of portals,—a decoration which had become common in other parts of France in the twelfth century,—nor did the portals of Normandy ever become enriched with such a luxury of mouldings as finally appeared in the Norman portals of England. The portals

---

[a] Frésne Camilly.

of Normandy always retained rather a more Roman character.

The most common mouldings are the billet, the nail-head, the chevron, the zig-zag or embattled frette, hatchet, nebule, star, rope, beak-head, dog-tooth, and, occasionally, different sorts of foliage, as the vine, the bay, the ivy, &c. Most of these mouldings were borrowed from other parts of France; even the zig-zag, which we have been accustomed to consider as so peculiarly Norman, is not of Norman invention.

The external cornice, carried round the eaves of churches, was sometimes a moulding describing a series of semicircles, under a projecting course, and sometimes a series of blocks. These blocks were soon ornamented, in imitation of the custom already prevalent in other parts of France, and became so many heads of men and animals, always grotesque. These ornamented corbels, on the exterior of churches, were adopted by the Normans before imagery was admitted into the interior of the edifice.

The roofs of the early Norman churches were of wood, except the part over the semicircular chancel, which from the first was vaulted with stone. The side aisles were also vaulted with stone; as were, sometimes, the comparatively small naves of village churches; but it is much to be doubted whether stone vaults were thrown over the wide naves of the larger churches of Normandy, before the 12th century [a]. In the second half of that century they became habitual, and were ever after adopted.

The vaulting was composed either of small stones let into a bed of mortar, or of tufo, or of a light calcareous stone, which is found in many parts of Normandy.

The most ancient vaulting is without ribs, and the most ancient ribs are without mouldings.

---

[a] In the churches of the Rhine stone vaults were introduced more than a century before; sooner than they were in any other country, after the loss of Roman art in the dark ages.

The ribs are usually interlacing semicircles. The ribs are of ashler, and the intervals between them are filled up in the manner already described. Sometimes the ribs are a series of arches in the horse-shoe form [a].

The dome vaulting over the side-aisles of Bernay is the only specimen of the kind which I saw in Normandy.

The first, and purest Norman style, prevailed till the latter part of the reign of William the Conqueror, from the early part of the tenth till nearly the end of the eleventh century.

Of the very earliest buildings of the Normans, not a specimen remains of which the date can be established with any certainty—scarcely any thing of the tenth century.

The abbey church of Bernay, which must have been begun in the first half of the eleventh century, is the oldest Norman building of any consequence which remains in its primitive form. The archi-

---

[a] Martinvast.

tecture of the interior is plain to baldness, but the dimensions are imposing.

The abbey churches of Jumiéges, and Cerisy, were begun in the first half of the eleventh century. The Norman portions of the cathedral, and of the church of St. Taurin, at Evreux, as also of the church of Mont St. Michel, belong to the same period.

St. Georges de Boscherville, and the two great churches at Caen, are splendid examples of the architecture of the time of William the Conqueror.

In all these buildings the character of simplicity is preserved, but some ornament in the details begins to make its appearance before the close of the Conqueror's reign, as, for instance, in the embattled frette moulding round the arches of the nave of Matilda's Church at Caen, in some parts of St. Georges de Boscherville, and other places.

The florid Norman was already developed in the early part of the twelfth century. Of this style a rich specimen is afforded in the arcade of the nave at Bayeux. The arches are ornamented

with a multiplicity and variety of mouldings of intricate design, and elaborate execution.

Another specimen of the florid Norman exists in the neighbourhood of Bayeux, in the church of St. Gabriel, built by Robert of Gloucester (1128).

When once the love of ornament prevailed over a more lofty sentiment, the vicious consequences soon appeared in an admission of the singular ornaments in which other parts of France had long rejoiced. From the corbels under the eaves the monsters descended to the portals, from the portals they found their way to the capitals of the interior, till, in the end, no part of the building was undisfigured by this heterogeneous and misshapen brood.

The abbey church of Montivilliers (1117), and the church at Graville, are instances of the florid style in all its exuberance.

The passion for these strange ornaments, appears to have been at its height in the first half of the twelfth century, and, in the second half, to

have moderated to a certain degree. In the chapel of St. Julien, built by Henry II., soon after 1162, a few monsters make their appearance, but they are not largely admitted, and the whole of the building affords a proof of a greater refinement of taste.

So long as the round style prevailed, the Normans never introduced escutcheons of arms as an ornament.

CASTLES AND DOMESTIC BUILDINGS.

The towns, and ordinary houses of the Normans, were entirely built of wood, and, for the most part, are so to this day. Their castles, having but one destination, that of defence, aimed at nothing but strength in their plan, or construction. A site was also selected which was already fortified by nature.

The plan of the Norman castles was as nearly the same as the diversity of ground would allow. The principal feature was always the keep, which contained the apartments of the lord of

the castle, and was also meant to be the last refuge of the garrison, if the outer works were forced. The keep was usually raised on an artificial mound, or placed on the edge of a precipice. The walls, strengthened in every way that art could devise, were of immense thickness, and composed of grouting poured in between two solid walls of stone. The facing consisted sometimes of irregular courses, and sometimes of small squared stones, after the Roman manner. Ashler was usually introduced at the angles of the building. The windows were few, and little more than chinks, unless very high up, or turned to the court. The door of entrance could only be reached by a staircase.

Under the keep were usually vaults, or dungeons, for the reception of prisoners.

The keep was enclosed in two courts surrounded by walls flanked with towers. The tower at the entrance was called the barbican, and served at once for an outwork and post of observation. The whole fortress was defended by a moat.

The remains of the Norman castles which exist scarcely afford any specimens of early Norman construction, almost all these castles having been besieged, destroyed, and rebuilt, over and over again.

The keep of Falaise is perhaps the only castellated remnant of early Norman times.

The castle of Gisors, which was built by William Rufus, retains nothing of its original construction.

The same must be said of Chateau Gaillard, the creation and pride of Richard Cœur de Lion. He pushed on the works with so much eagerness, that the whole castle was finished within the year. But it was captured more than once, in after times, and though from its highly picturesque situation, its more modern towers will always be seen with pleasure, it retains nothing to throw light upon the workmanship of the twelfth century.

Of the Chateau of Neaufles, a single, large, round tower, surrounded by a deep ditch, is the only vestige.

The remains of the Chateau sur Epte are considerable; but its architecture is a mixture of late Norman, and early pointed.

Vestiges of many more castles remain, but all are late Norman, or later still.

In some of the castles, more commodious or splendid apartments were introduced, separate from the keep, and favoured with a more liberal allowance of light and air. But, in early times at least, the windows were always turned to the court, and the habitable rooms were raised on arches from the ground. In after times, when danger was less perpetual, the domestic apartments of castles were permitted to be more enjoyable. The hall, within the walls of the castle of Lillebonne, is an example of the earlier kind.

The round, or Romanesque style, prevailed in Normandy till nearly the close of the twelfth century.

The instances of the pointed style supposed to belong to the eleventh century, have been already

shown to be pure imaginations. Coutances, Mortain, and Séez, no longer disturb generally received opinions, and after having relieved ourselves from the momentary uneasiness excited by the announcement of a new hypothesis, we quietly return to the established creed.

The chapel of St. Julien, the older part of the abbey church of St. Sauveur, the abbey church of Mortemer, that of Savigny, (begun in 1173,) and various other buildings, sufficiently prove that the circular style remained in general use till nearly the close of the twelfth century.

About that period, pointed arches began to make their appearance in Normandy, mixed, at first, with the round forms of the preceding style. The Normans, like so many others, are much disposed to believe that the new style began with themselves, and attribute its origin, as others have done before them, to the accident of intersecting circles; but this hardly appears to be a satisfactory solution of the problem;—and, as the pointed style had already been introduced in other parts

of northern France [a], it is not necessary to have recourse to a double discovery, to account for its appearance in Normandy.

The chapter-house of the abbey of Mortemer,

---

[a] As a proof of this position may be adduced, amongst other instances, the works of Abbot Suger, who introduced the pointed style in his restoration of the church of St. Denys. The first consecration of his fabric took place in 1140. A second, in 1144.

Notre Dame was rebuilt in the same style not long afterwards.

It is a curious fact, that the first appearance of the pointed style took place, in many countries, about the same time with their first reception of the Knights of the Holy Land. This was the case in Paris, and its immediate neighbourhood. The Knights Templar were first established in Paris about the same time that Abbot Suger began his reparations; and one of the earliest instances of the pointed style in Germany, is to be met with in the chapel of Cobern, at no great distance from Coblentz,—if the general belief is well founded, that this chapel was built by one of the knights who accompanied the Emperor Frederick Barbarossa to the Holy Land, and who had the more fortunate fate to return. Barbarossa perished on the frontiers of Syria, in 1190, from imprudently bathing in the river Saleph.

(before 1174,) and the chapter-house at St. Georges de Boscherville, (about the close of the twelfth century,) are the earliest specimens of the transition style in Normandy, upon the dates of which reliance can be placed. There is too much uncertainty about the Abbaye Blanche, Hambye, and Luzerne, to admit those buildings as evidence.

In the transition style of Normandy, the only change is in the shape of the arches; not in the spirit, or character, of the architecture. The pillars, with their Romanesque capitals, the mouldings, and the ornaments, are all repetitions of those which are found in buildings in the round style.

At the same time, it should be remembered, that elevation had always been an object with the architects of Christian temples, and that, as art had begun to revive, the masses had become less heavy, and the forms, especially of the pillars, had begun to lengthen. It has often been remarked, that the genius of the Roman style is diametrically

opposed to the genius of the pointed style; that, whilst the former delights in uninterrupted horizontal lines, and is indifferent about rising into air, the latter thinks of nothing but shooting upwards. This is perfectly true, if buildings in the pointed style are contrasted with the classic architecture of remote antiquity. But as soon as the Romans began to build *churches*, they made the building a story higher than they had been accustomed to make temples; taking, not the temple, but the basilica, for their model. This change of plan, introduced an increase of elevation, and whenever art was not in a state of prostration, architects made churches as lofty as they knew how. The pointed style, however, containing within itself the up-shooting principle, opened farther views, and added facilities, of which skilful men soon began to avail themselves.

The change appears to have first taken place in the vaulting, which appears to have become pointed (as at Blanchelande and Mortemer) whilst every thing else continued to be round.

The windows were the first to follow, and now assumed the lancet form, undivided by mullions. The very long lancets are the latest of their kind [a].

The portals next underwent the change, which afterwards communicated itself to the arches of the nave, and, by degrees, to every part of the building.

The new fashion scarcely made its appearance in Normandy before it became confirmed. The alterations in the church of the Abbey of Fécamp, which are early pointed, were in progress in the year 1200, and the reconstruction of the cathedral of Rouen was begun within a year or two afterwards.

From the change of style a change arose in the shape of the apsis, or chancel. No longer semicircular, it became polygonal; and, in Normandy, in almost all great churches, polygonal the chancel remained. In village churches it is sometimes

---

[a] "Les lancettes tres longues sont posterieures aux lancettes courtes."—Architecture du Moyen Age.

square, and at Louviers there is a church of large dimensions, which has a square chancel; but, as this shape was rarely adopted in the most considerable buildings, the east window never became a leading feature on the continent.

The early pointed, of which the generic feature is the lancet window, undivided by mullions, prevailed in Normandy till the second half of the thirteenth century.

In the course of that period, a step in advance was made in the windows, by enclosing two, or three, lancets in a pointed arch common to all, and ornamenting the space between the heads of the lancets with the figure of a rose or a trefoil.

In the course of that period, external buttresses became more important. Now employed to divide with the walls the task of supporting the now habitual vaults of stone, the buttresses projected further, and rose higher. Becoming thus more conspicuous, they were soon turned to account as additional ornaments, and capped with pinnacles

and crockets. Progressive science called the flying buttress into existence, that powerful auxiliary of the favourite object of the pointed style. At first the flying buttress was quite plain, but acquired ornament by degrees.

The cathedral of Lisieux is a good specimen of the early, but confirmed, pointed style in Normandy. This church illustrates a remarkable difference in the pointed style of France and England.

The pointed style, in France, always retained much of the Roman character. Single pillars continued to be more frequently introduced in the French than in the English churches. Pillars, instead of piers, usually surround the choir. Their capitals are much more studied imitations of the Roman. Roman patterns appear in the mouldings. In many buildings the only difference is in the form of the arch. This arose from the universal manner in which the old Roman style had been adopted in France, and the length of time during which it remained undisturbed.

A vast impulse, principally arising from the vivifying effects of the Crusades, and in France, from the immediate exertions of St. Louis, was communicated to architecture at the close of the first half of the thirteenth century. The chapel which St. Louis added to the palace at Paris, was consecrated in 1245, and is an epoch in French architecture. From this moment, the principle of elevation rapidly progressed, and the pointed style advanced in successive stages of science and beauty. At the beginning of the fourteenth century, a change made its appearance, which has recently acquired the fanciful appellation of the Flamboyant, from the supposed resemblance of the upper traceries of the windows to the shape of waving flame—but, after all, the Flamboyant is nothing but the commencement of the Florid, and, perhaps, is not distinct enough to deserve an appellation of its own. At first the vices of the Florid were not fully developed, and beautiful effects continued to be produced; but minute and elaborate ornament was, in fact, its real characteristic,

and this gradually led to the faults of exuberant decoration. In the course of the fifteenth century, the pointed style began to decline in Normandy. It became surcharged and obtuse. It lost its fine proportions, and, gradually, ceased to please. It lingered on till the beginning of the sixteenth century, when a taste for classic forms began to obtain, and the pointed style gave way to the revival of the Roman.

CHAPTER XXIV.

NORMAN ARCHITECTURE IN ENGLAND.

Having traced the fortunes of the Norman style in its native province, let us now enquire how it fared in England.

Of the architecture which existed in this country previous to the introduction of the Norman, there are no certain vestiges. The most competent authorities have decided that hardly any thing which can be proved to be Saxon remains in existence. Parts of a few churches, which have all the marks of a very remote antiquity, and of which the style differs materially from the Norman, may be suspected to be Saxon. Their distinguishing features are a ruder imitation of the

Roman [a], projecting, instead of recessed pillars, and the combination of diagonal with perpendicular forms in the external ornaments of towers. Such is the case at the old church of Barton, in Lincolnshire, and at Earl's Barton, in Northamptonshire. The only testimony I can add on this subject is, that we met with nothing of the sort in Normandy.

Some persons have imagined that the generality of the Saxon churches were merely timber buildings—but this appears to be a mistake; for in Domesday Book, which takes note of 1700 churches [b], one, and only one, is specified as being built of wood; and Henry of Huntingdon, speaking of a particular church, says, "It was not built of stone, but of wood, and covered with reeds, as is the custom in Scotland;" thereby

---

[a] In the towers of Barneck and Whittingham.

[b] It is singular that, in Domesday Book, no notice whatever is taken of any church either in Lancashire, Cornwall, or Middlesex.—Introduction to Domesday Book, by Sir Henry Ellis.

demonstrating that it was *not* the custom in England.

Not only were the Saxon churches not merely timber buildings, but some of them, as we learn from the old historians, were constructed at a considerable expense, and with much architectural ornament.

In the seventh century, a church was built at Lincoln, which Bede says was of stone, and of good workmanship. The church of the monastery of Wermouth was erected in 675, by Abbot Benedict Biscopius, a noble Northumbrian, who, at twenty-five years of age, detached himself from the service of King Oswy, and embraced a religious life. He brought over masons from France to build his church *in the Roman manner*, and, when the building was nearly finished, he procured artificers from the same country, skilled in the mystery of making glass, to glaze the windows.

The conventual church of Ripon, and the cathedral church of Hexham, were both built by

Wilfrid, bishop of York, in the second half of the seventh century; and were both constructed of stone, and supported by pillars and arches. Wilfrid, also, imported builders and artists from abroad—from Rome, Italy, France, and other countries.

In the eighth century the monastery of Croyland was built by Ethelbald, king of Mercia; and the church of St. Peter at York, was rebuilt by archbishop Albert, and consecrated just before his death, which took place in 780. Alcuin describes this church as having pillars, arches, and porticos.

In the ninth century the progress of the arts was interrupted by the constant incursions of the Danes. All that had been done was destroyed; and little more than repairs, and military works, could be undertaken till the peaceable reign of Edgar, in whose time the abbey of Ramsey was founded, and the church built by Ailwin, then alderman of all England. This church was built in six years, and finished in 974. It was in the

form of a cross, and had pillars, arches, and two towers, one of which was supported by four pillars, or piers, in the middle of the building. This appears to have been the first English church that had a tower so situated, or that was built in the form of the cross.

From these descriptions of the Saxon churches, preserved in the early chronicles, it appears that the Saxon style was, like that of every other country, an imitation of the Roman; but it also appears, that, when a building of particular consequence was attempted, it was customary to import architects and artificers from abroad,—which sufficiently proves that the artificers of this country were at that time inexpert. The Romans had not been long enough established in England to have generally instilled a knowledge of their arts, or to leave any great number of models behind them, and the disastrous times which followed threw back whatever little advances art had made.

We cannot, therefore, but come to the conclusion that whatever was executed in Saxon times,

by native workmen, was a less successful imitation of the Roman than that of other countries; and there is every reason to believe that even the buildings which are so much eulogized were of no large dimensions. The abbey church of Ramsey, which was one of the latest, and one of the most celebrated of the works of the Saxons, was completed in six years, which could not have been the case had it been on a scale at all commensurate with the works of the Normans.

The last Saxon work of importance was the abbey church of Westminster, built by Edward the Confessor, and finished, and consecrated in 1065, one year before the Conquest. This church is represented to have been of a different character[a] from that of any preceding structure in England; and this difference undoubtedly consisted in an approximation to the Norman method of building. Edward the Confessor had been brought up in Normandy, and was almost reproached for his in-

---

[a] "Novo compositionis genere."—Mathew Paris.

cessant endeavours to introduce Norman customs and manners. But even this improvement on preceding works in England, must have been very inferior to the architecture of the cotemporary churches of Neustria. Some vestiges of Edward's work exist; portions of wall, an arch high up in the south side of the choir, and his treasury, which opens out of the cloisters; here are pillars and arches, strongly built in the Roman fashion, but of a most primitive character.

In speaking of the churches and monasteries which arose after the Conquest, William of Malmsbury again uses the expression, that they were constructed after a new manner of building. From all this it appears that there must have been a marked difference between the Saxon and the Norman fabrics. But, as both were an imitation of the Roman, the difference must have consisted in the dimensions, and the superior workmanship and magnificence, of the new structures. It must have been the same style on a grander scale, and executed in a more scientific manner.

The fact is that, at the time of the Conquest, the Anglo-Saxons were in every respect a ruder and less civilized race than the Normans had by that time become. The Saxons are described as wasting large means in riotous living, in low and mean houses, whilst the Normans, on the contrary, lived temperately in their stately mansions. The architecture, like the manners of the Saxons, was of a coarser kind.

Size and grandeur, then, superior workmanship, and the ornamental addition of mouldings and enrichments, must have been the new features which the Normans communicated to the architecture of this country,—and the person who seems, more than any other, to have been instrumental to this improvement, was the celebrated Lanfranc, whom the Conqueror brought from the abbey at Caen to fill the high situation of archbishop of Canterbury; and who was not only active himself in constructing churches on a larger scale, but was also the means of bringing into this country other men who trod in his footsteps. Gundulfus,

a monk of Caen, who was one of the best architects of his time, was selected by Lanfranc, for those abilities which he knew him to possess, to fill the see of Rochester; and Paulus, who rebuilt the abbey church of St. Albans, was Lanfranc's nephew.

The earliest work of the Normans which exists in this country was conducted by Gundulfus, who, after rebuilding his cathedral at Rochester, was employed by William to superintend the construction of the White Tower, in the Tower of London; which contains within its walls perhaps the only ecclesiastical remnant of the Conqueror's time at present in existence.

The chapel, within this tower[a], is of itself a proof that the arts in England were, at that time, less advanced than they were in Normandy. In no other way can we account for the inferiority of this church, constructed under the superintendence

---

[a] "Dum idem Gundulfus, ex præceptis regis Gulielmi, præesset operi magnæ Turris Londoniæ."—Textus Roffensis.

of one of the best Norman architects, to cotemporary buildings on the other side of the water. Here we have the heavy columnar piers, which are so usual in the Norman churches of England, and so rare any where else. The whole building is ponderous and rude.

The roof of the church, though plain, is of a singular construction. It is a vault composed of small flat stones fixed, wedge-wise, in a bed of cement. This bed of cement must have been supported by a wooden framework till it acquired consistency. This kind of roof was called barrel vaulting.

In the course of the Conqueror's reign several cathedrals, abbeys, and castles were built, none of which remain in their original state. A remnant of the Conqueror's time existed at Canterbury till within these few years,—the northern tower, at the west end of the cathedral. This was a part of the work of Lanfranc. The stones of which it was built were irregular, and the joints between the courses were wide.

Several castles have the reputation of being of the Conqueror's time, but, on a close investigation, will be found to have been rebuilt in after years. Such is the case with the castles of Norwich, Rochester, the keep at Conisborough, and many others.

Within less than a century after the Conquest, almost all the cathedrals and abbey churches of England, besides innumerable parish churches, were either wholly rebuilt or greatly improved by the Normans whom William and his successors introduced into all the best ecclesiastical preferments[a]. By the introduction of these Norman prelates, the Norman style was rapidly diffused, at first, however, so much affected by the state of art in this country, as to give to the English building the character of a Norman building of much greater antiquity.

Much was accomplished in the short reign of Rufus, who was himself a great builder, and

---

[a] Bentham's Ely.

heavily taxed his English subjects to gratify his architectural propensities. His principal work was the great hall of his palace at Westminster. This hall, as it now exists, was altered by Richard II., but much of the original work was left, and, during the late repairs, portions of this were visible. The lower part of the walls was faced with rubble[a]; the courses were irregular; the joints, wide. Remains of a triforium or gallery were discovered, which had been carried along the sides of the hall, half way up. The capitals of the pillars on which the round arches of this gallery rested, were plain cubes. The whole of the workmanship was coarse.

The universal plan of the churches erected

---

[a] Rubble is the opposite to ashler. Ashler work consists of squared blocks, worked to a smooth surface, and laid in regular courses. The term rubble, on the contrary, is applied to irregular masonry, whether in the inside of walls or on the outside.—It signifies stones, not squared, not worked to a smooth surface, not large in size, nor laid in regular courses.

about this time was the same as in Normandy. All were built with the semicircular chancel, which, in England, afterwards fell into such general disuse that few traces of its existence are to be found in this country. It is, however, to be traced in St. Bartholomew-le-Grand's[a], in London, (begun in 1123,) in the minster at York, East Ham, Essex, and in other places.

The arches of the nave usually rested on those heavy columnar piers, which, in French churches, are hardly ever to be found, except in crypts, and which, probably, became so habitual in England from that having been the Saxon manner of imitating the Roman, as well as from the inexpertness of the native workmen. Sometimes, to adorn the columnar piers, the Anglo-Normans introduced the

---

[a] The pointed arches, under the Tower in St. Bartholomew-le-Grand, will, on close inspection, be found to be insertions. In the same way William of Wykeham changed the style of the Norman arches of the nave at Winchester.

spiral groove winding round them, and the net, or lozenge work, spreading over them.

The windows and the doors were the same as in Normandy, and the Norman mouldings were gradually introduced with little alteration.

The walls were remarkably thick, and without prominent buttresses.

Specimens of the time of Rufus are to be seen in the choir, side aisles, and middle transept at Durham[a]; in the walls of the lower part of the western façade of Lincoln ; the towers and transept of St. Alban's[b]; the oldest remaining parts of

---

[a] The Norman parts of the churches of Waltham and Selby so much resemble Durham as to make it next to certain that they were built about the same time.

[b] Mathew Paris, the monk of St. Alban's, says, that Paulus, a monk of Caen, became Abbot of St. Alban's in 1077, and that, with the advice and assistance of Lanfranc, he begun the church eleven years after he became abbot. The church was consecrated in 1115, in the presence of Henry I. and his Queen.—Mathæi Paris, Monachi Albanensis, Angli, Historia Major.

Winchester, and the east end and cross aisle of Worcester.

The walls, in this reign, were irregularly built, and the joints continued to be wide, as may be seen at Durham, Lincoln[a], Winchester, and other places.

The proportions were too short for the height, and produced an heavy appearance. The pillars were thick and stumpy; their capitals were plain to baldness.

When we contemplate the Anglo-Norman

---

[a] Remigius was originally a monk of Fécamp. He is described as a little man, of a swarthy complexion, but great capacity, and the selection of the unrivalled site of Lincoln Cathedral is of itself a proof of genius. Before Remigius began his operations at Lincoln he built a church at Stowe, near Gainsborough, where was an abbey, celebrated for its possession of the body of St. Oswald. The old Norman portions of this church are roughly built with small stones in irregular courses. The walls are very thick. In the south side of the nave are small, round-headed windows, of which the arches are turned with thin stones, in the same manner with the supposed Roman window, of Brixworth, in Northamptonshire.

buildings of this reign and compare them with St. Georges de Boscherville and the two great churches at Caen, we cannot refuse to admit that the arts in England, even in the time of the son, were considerably behind the arts in Normandy, in the time of the father.

The same style prevailed in the early part of the reign of Henry I., as may be seen by the ruins of St. Botolph's Priory, Colchester, which was built by Ernulph, a Norman monk, in the first years of that prince. Here are the same heavy columnar piers, the same stumpy proportions, the same poverty of mouldings. But, in the course of this reign, an impulse was given to architecture by one of those men of genius, who affect the character of the age in which they live. Roger Poor[a], Bishop of Salisbury, a Norman by

---

[a] Roger Poor was originally the priest of the church in the suburbs of Caen. Henry, before he came to the throne, being at Caen, accidentally went into this church to hear mass, with some of his officers. Roger Poor, who had an idea that soldiers liked short masses, to recommend himself

birth, and combining in himself the offices and the qualities which, in those times of constant commotion, were frequently united, was distinguished as a prelate, a warrior, a statesman, and an architect. Little scrupulous about the manner in which he acquired his resources, he largely expended them in buildings which were either to secure his power or to perpetuate the memory of his magnificence. He built cathedrals, castles, and mansions, and required them to be

---

to the prince, hurried through the service so fast that it was over almost as soon as it was begun, and, by so doing, gained his object. Henry took him into his service, and, with this advantage, Roger Poor's abilities, which were really great, soon achieved the rest. Henry, now become king, heaped benefices upon him, and conferred the bishopricks of Ely and Lincoln upon his brother's two sons, Alexander and Nigellus. Alexander imitated his uncle's example in raising splendid buildings; he nearly rebuilt the cathedral of Lincoln, and built the castle at Newark. Nigellus, on the contrary, wasted his wealth on hawks and hounds. All three were brave warriors, and distinguished themselves in the subsequent struggle between Stephen and the Empress Maud.—*Præsules Anglorum.*

constructed in a style so superior to what had before been customary, that a record of the improvement which he communicated to architecture is preserved in the page of history. William of Malmsbury relates, that the walls which were built under the superintendence of Roger of Salisbury were so smooth, and had such fine joints, that they seemed to be made of a single stone. Had fine joints been in use before, their appearance in the works of this prelate would not have been so much extolled. The admiration with which they are mentioned, gives us the date of the first introduction of fine joints in the walls of English buildings. From this time progressive improvement took place in other parts of the fabric. Something like decoration was added. The portals began to be enriched. The architecture of England ascended to the level of the architecture of Normandy in the time of William the Conqueror.

Examples of the style of this reign may be seen in the naves of Gloucester, Norwich, Ely, Durham,

and Southwell[a]. In the lateral towers of Exeter cathedral, built by Bishop Warlewast, who sat from 1107 to 1136. In St. James's tower, Bury St. Edmonds. The chapter-house at Rochester, built between 1114 and 1125, by the same Ernulph who built St. Botolph's at Colchester, and who, on the death of Gundulph, was promoted to the see of Rochester. In the portal of the round church at Cambridge[b]. In the nave of the church of Dunstable. In St. Bartholomew-le-Grand's, Lon-

---

[a] The early history of Southwell Minster is lost in obscurity, but Thomas the Second, who was Archbishop of York, in the reign of Henry I., is mentioned as having taken great interest in the fortunes of that church. It seems, therefore, probable, that the present minster was begun in his time. The transepts cannot be so old; for in them the proportions are more elongated than was the practice in the reign of Henry I., and there is more ornament both within and without. The windows, in this part, are enriched externally with double mouldings. The portals are later still.

[b] Essex on Round Churches.—Archæologia, Vol. VI. p. 178.

don, which was begun in 1123. In St. Sepulchre's, Northampton, built by Simon de Liz, second Earl of Northampton, on his return from the Holy Land. He died in 1127. In the abbey church of Tewkesbury, begun by Robert Fitz-Hamon[a], (who died in 1107,) and consecrated in 1123.

The same improvement was progressive in the reign of Stephen. The proportions became more graceful. The mouldings became more numerous and varied. The pillars began to lengthen, and foliage appeared on their capitals.

---

[a] Robert Fitz-Hamon was the Norman Lord of Gloucester. At the siege of Falaise, in Normandy, he received a blow on the head from a lance, after which he was never in his right mind, and died at the end of two years. This was considered a punishment for his having been the cause of the destruction of the churches of Bayeux, as it was principally to effect Fitz-Hamon's liberation that Henry I. set fire to the town. It was the eldest daughter of this Fitz-Hamon that Robert of Gloucester married, and with her obtained Fitz-Hamon's extensive possessions in England and Normandy.

Examples.—Portal of the Chapter-house at Durham, built by Bishop Galfrid Rufus, between 1133 and 1143. Church of Castle Acre Priory, Norfolk, consecrated in 1148. Church of St. Cross[a], Hampshire. Ripon Minster[b]. St. Frideswide[c], (now Christ Church,) Oxford,

[a] Here appear the interlacing semicircles, the intersections of which produce the form of the pointed arch, and which are by some supposed to have been the origin of the pointed style; but, on this subject, enough has been said already. The intersections at St. Cross have evidently been pierced for windows at a period subsequent to the original construction of the building. The whole of the original building is in the round style.

[b] The first stone of Ripon Minster was laid in 1140, by Thurstan, Archbishop of York. The round arches under the central tower, and the round-headed windows in the transepts, &c., denote the style in which the work was begun. The lancets of the west front are a proof that the west front was added many years afterwards,—a circumstance which is easily accounted for by the death of Thurstan in 1143, and the state of the see and cathedral of York during many subsequent years. Ripon Minster was greatly damaged by fire in 1317, and restored by Archbishop Melton in the time of Edward III.

[c] Ingram's Memorials of Oxford.

begun not later than 1150, and finished in 1180.

About this time, or a little later, Domestic Architecture began to make its appearance in England, though, from the dimensions and arrangement of some of those buildings which have come down to our time, it is difficult to determine whether all of them were destined for dwelling-houses or were only halls for public occasions, or for holding the courts of the Feudal lords.

Of these buildings the invariable plan is a parallelogram of two stories; sometimes a double parallelogram. The lower story was vaulted, as we have seen to have been the custom in Normandy, and it had no internal communication with the upper story. The upper story was approached by an external staircase, which, probably, was moveable. The only fixed Norman staircase now extant is the one at Canterbury.

The probability is that the lower story was

occupied by the servants, and the upper story by the masters; but, in none of the buildings of this time now extant, do there exist any traces of subdivisions.

An example of Norman domestic architecture existed in Southwark[a] till within these few years. It was the Hostelery or town residence of the priors of Lewes. The church of St. Olave, Southwark, was confirmed to the prior and convent of Lewes, by William, second Earl Warren and Surrey, the son of the founder. Earl William died in 1138. It appears, however, that the priors of Lewes *rented* a building in 1170 and 1186, for their occupation in London; from whence it may be concluded, that the Hostelery in question was not built till after that period. The general features of the portion of the hostelery which remained till lately, nearly resembled those of the Manor-house of Boothby Pagnel, Moyse's Hall, at Bury St. Edmund's, and

---

[a] Archæologia, Vol. XXIII.

the building which is called Pythagoras' School, at Cambridge.

In 1826 was still existing, at Barneck in Northamptonshire, a Norman manor-house, which was not built for defence. In this instance, the hall, which was the principal feature, was on the ground floor, and had no vaults underneath. The hall consisted of a centre and two side aisles. The fine joints of the walls of this building denoted that it could not have been built much before the middle of the twelfth century.

At Bury St. Edmund's is a Norman domestic building, which goes by the name of Moyse's Hall. Here are *two* parallelograms; in both are two stories, the upper story resting on vaults. The upper story of the most considerable building appears to have consisted of one large room, probably the hall. Nothing remains to show how the space was divided in the smaller parallelogram. Traces of adjoining walls exist, as if the buildings had once been more extensive.

At Boothby Pagnel[a], in Lincolnshire, is a Norman manor-house on nearly the same plan. In this are a fire-place and a chimney, which indicates that the building, of which it forms a part, cannot be older than the second half of the twelfth century. This edifice has windows in the ends, as well as the sides, a circumstance which makes it evident that, to this building, no other buildings could have been attached. It is surrounded by a moat.

At Christchurch, Hants, is a Norman remnant which has also a chimney.

At Lincoln is a Norman domestic building, which goes by the name of John of Gaunt's Stables, but which, in fact, was the public meeting house of a guild. It is so much enriched as to place it late in the reign of Henry II.

These examples prove that, about the middle of the twelfth century, mansions, that were not castles for defence, began to be erected in

---

[a] Boothby Pagnel was first brought into notice by Mr. William Twopeny, of the Temple, whose architectural drawings are equally beautiful and correct.

England; and that, independent of colleges, abbots' lodgings, and the habitable parts of convents, instances existed of domestic architecture. But it was long before dwelling-houses acquired a character bearing any relation to the quality of the proprietor, or were constructed with much regard to convenience.

During the early part of the reign of Henry II., the same style with that of the reign of Stephen continued to prevail; but, gradually more and more enriched, gradually became the florid Norman—that style which we have seen to exist in Normandy about thirty years sooner. Varied and elaborate mouldings surrounded the arches of the naves—the portals were more and more ornamented—the capitals were covered with foliage—figures were introduced [a]—but the grotesque and monstrous brood which were so prodigally displayed in Normandy were only sparingly admitted in England. On the other hand, the Anglo-Norman churches never exhibited such near ap-

---

[a] As at the magnificent portal at Rochester, which is far superior to any Norman portal in Normandy.

proaches to the Roman as are usual in the details of the churches of Normandy. In this country detached single pillars were much more rarely introduced, nor did the capitals of pillars often attempt so close an imitation of classic models. More of the Roman hangs about the French Norman; more enrichment was imparted to the English; but not till the reign of Henry II.: and this is so certain, that nothing which is very much enriched, as the Norman portions of the abbey church of Malmesbury, can be admitted to claim an earlier date.

Examples of the Norman style of the time of Henry II. are to be seen in the Abbey gateway, Bristol; in the Galilee, or chapel, at the west end of Durham, built by Bishop Pudsey (1154 to 1197), together with the lateral portals of the nave; in the new nave and great west portal of Rochester [a], &c.[b]

---

[a] Rochester cathedral was twice destroyed by fire—in 1138, and again in 1179. The existing nave, and the great west portal, must have been built after the second fire. See Edward de Hadenham and Chronicon Gervasii.

[b] Iffley church, Oxfordshire; St. Peter's, Oxford; and St. Peter's, Northampton, must belong to this period.

It was in the latter years of the reign of Henry II. that the struggle between the round and the pointed style, which is called the transition, began to take place in this country.

Of this change early examples survive at Kirkstal, and Roche Abbey, in Yorkshire. Owing their existence to the same cause, and built at nearly the same time, they resemble each other in style. Each was Cistertian, and each owed its existence to the feud which had arisen in the wealthy Benedictine abbey of St. Mary's of York; from which a body of conscientious brethren, under the guidance of Prior Richard, had detached themselves to emulate the more perfect discipline of Rivaulx, the earliest Cistertian foundation in the north of England[a]. Some of these monks established themselves under the trees at Fountains; others wandered on to the romantic glen in which Roche abbey afterwards arose. Prior Richard's brother, Alexander, was invited by Henry de Lacy to become the head of a Cistertian house which he was about to found at Kirkstal. The recluses of

[a] Hunter's Deanery of Doncaster.

Fountains were, in the first instance, the least prosperous, for their first buildings were burnt to the ground by a band of licentious soldiers; and it was not till 1204 that the foundations of the existing church were laid. Neither violence nor accident disturbed the early days of Kirkstal. Kirkstal Abbey was begun in 1153, and the same Abbot Alexander lived to see it completed, after the labour of thirty years. Some of those interruptions and delays, of which history takes no notice, seem to have interfered with the progress of Roche Abbey, for, though resembling Kirkstal in many respects, it has all the appearance of having been begun a few years later. The land on which it stands is said to have been granted by the Norman lords of Maltby and Slade Hooton, in 1147, and a Bull of Pope Urban, confirming to the monks all their possessions, implies that the monastic buildings, at least, were complete in 1186[a]. It is probable that the church

---

[a] The expression in Pope Urban's Bull is "locam ipsam in quâ abbatia sita est."

Buildwas Abbey, which in style much resembles Roche

was, also, by that time so far advanced as to be in use, but no precise information respecting it has come down to our time.

Kirkstal is of great value, as evidence, having been built in the thirty years preceding 1183; and here, as might be expected, the new fashion is but just admitted, and the old Norman has still the ascendant. The arches of the nave are pointed, but the pillars are massive, and the windows and portals are round. The church at Roche Abbey, though equally in the transition style, though it has round-headed windows above pointed arches, Norman mouldings, and Norman capitals, yet is of a less heavy character. Both buildings, however, denote that during those years the new style was only just beginning to be received in England.

About the same time, 1170, Archbishop Roger

Abbey, was founded not many years earlier, in 1135. But the same delays, whatever they were, may have intervened between the foundation and the construction in the one case as in the other. Occurrences of this sort are the real explanations of apparent anomalies in style.

employed the pointed style in the new crypt of York Minster.

But the early examples of the transition of which the dates are known with the most undoubted certainty, are the round part of the Templar's church, London, which was consecrated in 1185, and the choir of Canterbury, which was rebuilt after the fire in 1175, and in which the pointed style was introduced by John of Sens, a French architect. Other instances are to be found in the great tower at the west end of Ely, built by Bishop Ridel, who died in 1189; in the county hall of Okeham [a], Rutlandshire; in the abbey church of Glastonbury [b], &c.

---

[a] Camden ascribes the county hall of Okeham to Walkelin de Ferrers, a younger son of the Earl of Derby, who was made the first baron of Okeham in the twelfth year of Henry II.—Wright's Rutlandshire.

[b] Dugdale tells us that the abbey church and monastic buildings of Glastonbury were totally destroyed by fire in 1179. Henry II. contributed to their restoration. The repairs were carried on with so much zeal, that a consecration took place in 1186, but long before the restoration was

But the nave of Rochester and the nave of Peterborough, rebuilt between 1170 and 1194, are proofs that the old fashion was not at once superseded by the new.

Simultaneously with the introduction of the transition style, hewn stone vaults appear to have been first thrown over the wider parts of English churches, which till then had been habitually roofed with wood. A stone vault was thrown over the new choir of Canterbury in 1174. The monk Gervasius, in his minute account of the restoration of this choir, says, when pointing out the difference between the old choir and the new, "*There*, in the circuit without the walls, the vaults were plain; *here* they are arched and studded. *There* was a wooden ceiling; *here* an arch neatly formed of light sand-stone." From whence it appears, that before that time it was customary to roof narrow spaces with plain cross vaulting, but

---

complete; and after the death of Henry, from want of funds, the building was interrupted for several years. The style of the different parts is a commentary on the history of the fabric.

not customary to vault wide spaces with stone. Plain cross vaulting of rubble, with, and without, ribs, had been adopted before in crypts, side aisles, and chancels. Barrel vaulting we have seen introduced in the time of William the Conqueror. Giraldus Cambrensis relates that Bishop Alexander[a] introduced stone vaulting at Lincoln, the weight of which is supposed to have caused the walls to give way not many years afterwards; but the expressions of Giraldus are so ambiguous that we cannot feel sure of which part of the church he meant to speak; and the wooden roofs of Southwell, Winchester, and Peterborough, give us reason to believe that the stone vaulting at Lincoln did not extend beyond the aisles. From the time, however, that the choir of Canterbury was built, which was not long after it became habitual to throw stone vaults over the naves of the larger

[a] "Alexander Ecclesiam Lincolniensem, casuali igne consumptam, egregie reparando, lapideis firmiter voltis primus involvit."—Giraldus Cambrensis, in his Lives of the Bishops of Lincoln.

churches of Normandy, hewn stone vaults, plain at first and gradually enriched, became habitual in England. Not only were they adopted in new buildings, but they were substituted, in most cases[a], for the wooden roofs of our ancient cathedrals. Prominent buttresses, and flying buttresses[b], as in Normandy, followed in the train of the stone roofs.

In the early part of the reign of John (1202), Bishop Godfrey de Lacy may be said to have confirmed the pointed style in England, by the introduction of lancet windows in his reconstruction of the choir of Winchester.

About the same time Hubert Walter[c], Archbishop of Canterbury, (who died in 1207,) intro-

[a] "The nave of Durham received a stone vault in exchange for its wooden roof at the hands of Thomas Melsonby, who was Prior from 1233 to 1244. The choir was improved in the same way by Prior Hotóun, 1289."—Raine's Account of Durham Cathedral.

[b] Good examples of early flying buttresses are to be seen at Salisbury.

[c] Præsules Anglorum.

duced triple lancet windows in the chapel which he built at Lambeth.

From this time the round style fell gradually into disuse; but, at Fountain's Abbey, the foundations of which were laid in 1204, and which was in progress during the forty subsequent years, the windows and portals are still round-headed, and an instance of a round portal is to be found at Ketton[a], in Rutlandshire, so late as 1252.

During the reign of Henry III. the early pointed style attained its most perfect state, and, in that state, justly commands admiration. There is a manly vigour and chaste simplicity about it which enable it successfully to compete with any thing by which it was succeeded. Fine examples of this style are to be seen in the chapter-house, the transepts, and part of the choir of

[a] "Hugh de Welles, Bishop of Lincoln, by his deed, dated the 16th year of Henry III., granted release of twenty days' penance to all those who should contribute any thing to the building of the church of the Blessed Mary of Ketton, at that time ruinous. The new building is, no doubt, that which remains to this day."—Wright's Rutlandshire.

Westminster Abbey[a]; in the choir of St. Alban's; in the nave of Lincoln; east end of Durham; nave of Worcester, 1224; nave and spire of Lichfield; south transept of York[b]; and the older part of the choir of Southwell[c]. But no where is this style more beautifully developed than in Salisbury Cathedral[d], which was begun in 1221, and carried forward, without interruption, till it was completed.

The establishment of the pointed style was attended with one remarkable difference in England and Normandy. In Normandy the semicircular chancel became, generally speaking, polygonal; in

---

[a] As far as the first column westward from the central tower.

[b] York Minster was burnt in Archbishop Thurstan's time, and lay in its ashes thirty-four years, when a new choir was begun. Archbishop Walter Grey, who died in 1255, built the south transept.

[c] In 1235 an indulgence of thirty days was granted to those who contributed to the church of Southwell, for the consummation of the fabric, long since begun to be restored. —Dickinson Kestall's History of Southwell.

[d] Salisbury Cathedral was begun one year later than Amiens; but the latter is many years in advance of the former.

England, generaly speaking, it became square. Polygonal chancels are as rare in England, as square chancels are in the larger churches of Normandy, and this difference of shape in England afforded the opportunity of those magnificent east windows which are so principal, and so splendid, a feature of our cathedrals. Another difference, which may be remarked is, the battlement which usually forms the parapet of English churches, and which never occurs in the ecclesiastical buildings of France.

But the period which is usually selected as the golden age of the pointed style in England, is that which comprises the reigns of our two first Edwards;—the first period of what is called the "decorated style." During that time the pointed style acquired a just proportion of ornament, without suffering any diminution of its masculine character. Many competent judges include, in the best period, the reign of Edward III.; and the buildings erected in his time so little depart from the perfection of taste as hardly to deserve less

than unqualified praise. But the greater lightness, which architecture acquired during the reign of Edward III., and the greater enrichment, could not be obtained without a proportionate sacrifice of solidity and repose.

Examples of the reign of EDWARD I.—North transept, York Minster; part of the nave of Westminster Abbey[a]; central tower, Lincoln; Tintern Abbey; choir of Exeter; the greater part of Wells Cathedral, consecrated in 1239; Lady chapel and spire, Lichfield.

Examples of the reign of EDWARD II.—Nave of York Minster, begun in 1291 but not finished till 1336; south aisle of Gloucester Cathedral.

---

[a] As far as the second column of the nave.—From that time the work went on very slowly. Little progress was made from the time of Edward I. till that of Richard II. Henry V. contributed something. Henry VI. was occupied with buildings in other places. Henry VII. bestowed all his attention on his celebrated chapel. The nave, however, had been carried on, at intervals, by the abbots, and the west end was finished by Abbot Esteney, who died in 1498. —Widmore's Westminster.

Examples of the reign of EDWARD III.—Octagon lantern tower of Ely Cathedral; chapel of St. Stephen's, Westminster; new choir of York Minster, begun in 1361; western towers of York Minster, begun 1370; the choir of Gloucester Cathedral, but not finished till 1381; the more enriched part of the choir of Southwell and the chapter-house[a].

Soon after the accession of Richard II. a change took place in England, as it did about the same time, in France, but of a totally different kind, and offering a remarkable contrast to the preceding fashion. The flowing was exchanged for the straight. It became the great object to

---

[a] In the eleventh year of Edward III. a royal license was granted to the chapter of Southwell to get stone in the forest of Shirewood, for the purpose of the fabric of the minster.

Archbishop Neville is believed to have built, or begun, the Chapter-house. He was consecrated Archbishop in 1374. In the course of the following reign he fell into disgrace with the court, went abroad, and is said to have died, a schoolmaster, at Louvain.—Dickinson Kestall's History of Southwell.

produce as long a continuity of perpendicular lines as could be accomplished, and though, in process of time, this style was frittered away in minute subdivisions, yet, in its best days, it produced striking effects, taking possession of the whole end of a transept or nave, and by a repetition of the same pattern in the pannels of the walls and the tracery of the windows, turning the whole space into one magnificent feature. William of Wykeham's west end of the nave of Winchester, is a splendid example of this kind of composition, as is the east window of York minster of the perpendicular style.

Another change began to appear in the reign of Henry VI., a change which affected the most vital part of the pointed style. The arch began to expand, and gradually went on expanding, each time less beautiful, till it became obtuse and depressed; an alteration which, as we have seen, it equally underwent in France. This alteration, together with a continually increasing passion for enrichment, and for reducing the proportion of

the solid to the void, to gain more and more lightness, gradually produced the faults of the florid style, and led, first, to the corruption, and finally to the abandonment, of pointed architecture. It may appear singular to hint at progressive evil during the period when King's College chapel was built at Cambridge, and the chapel of Henry VII. at Westminster, but the seeds of debasement are often sown in the days of prosperity, and when once the utmost limits of good taste are arrived at, the next step leads into another region.

During the reign of Henry VIII. the pointed style became heavy and surcharged, an instance of which appears in the cathedral of Bath, begun about 1500, and finished in 1533. The style had lost its merit and its charm, and, during the course of the reign of Elizabeth, as in that of the reign of Francis I. in France, the pointed style went out of fashion, and a taste for the Roman returned.

In the foregoing pages it has been attempted to show—

1. That the supposed existence of the pointed style in Normandy, in 1056, is a pure imagination.

2. That the Normans, adopting the corrupt Roman style, gave it a character of their own.

3. That the Normans greatly contributed to the advancement of the arts in England.

4. That architecture performed exactly the same revolution in England and France, France having, in all the changes, a certain precedence[a].

---

[a] Though priority in the adoption of the pointed style cannot be allowed to Normandy, neither can it be denied to other parts of northern France.
